ACKNOWLEDGEMENT

I wish to record my sincerest sense of gratitude to my Reverend Teacher and Supervisor, Prof. (Mtv) Noorul Hasan Khan, Ex-chairman, Dept. of Library Science and University Librarian, Aligarh Muslim University, Aligarh, for his inspiring guidance, constant encouragement and continuous help throughout the period of this work. But for his kind cooperation, this work could never have taken the present shape.

My thanks are also due to Prof. (Md.) Sabir Husain, Chairman, Department of Library Science, AMU, Aligarh, who has been equally helpful to me.

I am highly obliged to my esteemed teachers for furnishing me with the details of the source material for the dissertation and for the valuable suggestions they gave me in the completion of this work.

Further I wish to acknowledge my indebtedness to my teacher: Mr. M. T. M. Khan, Reader, Department of Library Science, Bundel Khand University, Jhansi, for his moral boosting and help throughout the year.

I am also beholden to my class fellow, Mr. Sayeed Akhtar for helping me throughout the period.

As it is, I stand deeply indebted to my mother and brother who boosted my morale and courage in the course of preparation of this work.
I will fall short of my duty immensely without expressing my gratitude to the members of the staff of the libraries of Jawahar Lal Nehru Medical College, Aligarh, Sarojni Nyedu Medical College, Agra and I.C.M.R., New Delhi for providing me with unflinching help and facilities.

(PRATIBHA SHARMA)
AIM SCOP AND METHODOLOGY

AIM AND SCOPE

The present study is intended to bring at one place in the form of annolations all the significant literature that is available in the field of "Cancer" of human body. Although the bibliography is selective in nature, an attempt has been made to cover all the aspect of cancer.

I am confident that this bibliography will be helpful to all those who have some interest in the literature a cancer. The part I deals with what is cancer its nomenclature and classification according to different part of arranged according to the class number.

METHODOLOGY

While starting with this task, a general survey was made of the literature available in important libraries viz. Maulana Azad library, Jawaharlal Nehru Medical College Library Aligarh, Sarojni Naidu Medical College Agra and Indian Council of Medical research New Delhi. Out of all the periodicals containing this topic only important ones are selected for this purpose.

STANDARD FOLLOWED

As far as possible the Indian standards recommended for bibliographical references (IS:2381-1965) has been followed but some deviation are also taken into consideration. Abbreviation have used in the entries a list of which is given.
After searching the literature entries were recorded on 5"x3" cards. The entries in the bibliography contain abstracts made on 8"x5" cards abstracts giving essential information about the article.

**ARRANGEMENT**

The bibliographic part has been arranged in classified order according to class number given in "Colon Scheme of classification". The entries are serially numbered.

**INDEX**

The part III contains Author, Title, and subject indexes in alphabetical sequence. Each index guides to the specific entry or entries in the bibliography.

I hope they will found very helpful in consultation of the bibliography.

PART ONE
INTRODUCTION
There is no letter in the entire lexicon of medicine that strikes more terror than the word "Cancer" and with considerable justification. In the U.S. in 1978 it is projected that over one million individuals will learn for the first time that they have some form of cancer (about 390,000 will die of cancers). Approximately 18.5% of all deaths in the U.S. are caused by cancer; only cardiovascular disease causes more deaths. In the discussion that follows, some of the roots of this fear will be explored as well as some of the reasons why guarded optimism is now justified for the future. Although cancer understandably demands more attention, both benign and malignant tumors are considered in the following discussion. Attention is focused principally on their basic characteristics, morphology, and behavior as well as on a survey of where we currently stand in the search for their origins and causation(s).

2. The term cancer is originated from Neoplasia. Neoplasia literally means "new growth" and the mass of cells composing the new growth is a neoplasm, the term new growth does not adequately define a neoplasm. Much more meaningful is the definition of Willis: "A neoplasm is an abnormal mass of tissue, the growth of which exceeds and is uncoordinated with that of the normal tissue and persists in some excessive manner after cessation of the stimuli which evoke the change." To this characterization we might add that the abnormal mass is purposeless, preys on the host, and is virtually autothorny. It preys on the host insofar as the growth of the neoplastic tissue competes with normal cells and tissues for energy supplies and nutritional substrate.
Inasmuch as these masses may flourish in a patient who is wasting away, they are to a degree autonomous. Later it will become evident that such autonomy is not complete. All neoplasms ultimately depend on the host for their nutrition and vascular supply; many forms of neoplasia even require endocrine support.

The term tumor and cancer should be clarified. Actually tumor refers simply to swelling which is in fact, one of the cardinal signs of inflammation. While a neoplasm near the surface of the body produces the tumors swelling all tumors. Correctly speaking, are not neoplastic and may also be produced by hemorrhage or edema. Nonetheless, long historical precedent has equated the term tumor with neoplasm, and the other usage of tumor have new passed into limbo. Thus we have oncology (oncos = tumor) as the study of tumors or more correctly, the study of neoplasm. Cancer is the common term for all malignant tumors. The term cancer has ancient origins: "same says that it is so called because if adheres to any part that it Seizes upon in an obstinate manner like the erab".

The terms benign and malignant, as applied to neoplasms, have clinical implications. The designation benign implies that the lesion is not life-threatening, is relatively slow-growing, will not disseminate through the body (metastasize) and is amenable to removal, with cure of the patient, only rarely, will a benign neoplasm bill, and then by virtue of its strategic location or function. In contrast, nearly all malignant neoplasms have the ugly potentials of rapid growth, invasion and destruction of contiguous structures, and dissemination throughout the body, leading to death.
The nomenclature of tumors unfortunately does not follow any single consistent scheme. Most benign tumors are classified histologically by attaching the suffix "oma" to the cell type constituting the neoplasm. Thus, benign tumors composed of fibrocytes are termed fibromas and fatty tumors, lipomas. This system works well with mesenchymal benign tumors (there arising in muscle, bone, tendon, cartilage, fat, vessels, and lymphoid and fibrous tissue) because the tumor cells usually closely resemble their normal counterparts, and the various adult mesenchymal cells are sufficiently distinctive to be readily differentiated from one another. However, benign tumors of epithelial origin defy such easy classification. For example, the cells that line the ducts of the pancreas, the mucosal cells of the gallbladder and those of the fallopian tubes. Accordingly, benign epithelial neoplasms are variously classified, some on the basis of their cells of origin, others on microscopic architecture, and still others macroscopic patterns.

Adenoma is the term applied to the benign epithelial neoplasm which forms glandular patterns, as well as to the tumors derived from glands but not necessarily reproducing glandular pattern. On this basis a benign epithelial neoplasm that arises from intestinal lining cells growing in the form of numerous tightly clustered small glands would be termed an adenoma, as would a heterogenous mass of adrenal cortical cells growing into distinctive pattern but merely producing a small benign growth. Benign epithelial neoplasm producing microscopically or macroscopically visible foveolar-like or warty projections from epithelial surfaces...
are referred to as papillomas or polyps. Those that form large cystic masses as in the ovary are referred to as cystomas or cystadenomas. Some tumors produce papillary patterns which protrude into cystic spaces and are called papillary cystadenomas.

Malignant tumor nomenclature essentially follows the same schema used for benign neoplasms with certain additions. Cancers arising in mesenchymal tissue are called sarcomas (Sarco = flesh). A malignant neoplasm of fibrocytes is a fibrosarcoma, and one composed of fat cells is a liposarcoma.

Sarcomas are then designated by their histogenesis. Malignant neoplasms of epithelial cell origin, derived from any of the three germ layers, are called carcinomas. Thus cancer arising in the epidermis of ectodermal origin is a carcinoma as is a cancer arising in the mesodermally derived cells of the renal tubules and the endodermally derived cells of the lining of the gastrointestinal. One with a glandular growth pattern microscopically is termed as adenocarcinoma, and one producing recognizable squamous cells arising in any of the stratified squamous epithelia of the body would be termed a squamous cell carcinoma. It is further common practice to specify, when possible, the organ of origin—e.g., a renal cell adenocarcinoma or bronchogenic squamous cell carcinoma. Not infrequently, however, a cancer is composed of very primitive, undifferentiated cells and must be designated merely as a poorly differentiated or undifferentiated malignant tumor or, when possible, undifferentiated carcinoma or undifferentiated sarcoma.

Usually the proliferating cells of a tumor bear a close resemblance, to each other as though all came from closely related forebears. Thus, all the cells of the adrenal adenoma more or less resemble stratified squamous epithelial cells. In some tumors divergent differentiation of the neoplastic cells gives rise to more than one cell type within the neoplasm. Such neoplasms are categorized as mixed, the best example of
of which is the mixed tumor of salivary gland origin. Another designation of this lesion is a pleomorphic adenoma, indicating that it is basically a benign glandular tumor possessing divergent morphology— in some parts recognizable glandular epithelial formations, in other areas, apparent myxoid stroma, and in still other areas, perhaps glands, of pseudo cartilage (Fig. 4). Such mixed patterns should come as no surprise since ultimately all the specialized cells of the body are derived from a single fertilized ovum and, understandably, under neoplastic influences repressed areas of the genotype may become expressed.

Another category which might be differentiated is designated as terato-genous, to indicate a ceulent of a variety of cell types representative of more than one germ layer. These neoplasms, called teratomas, arise from totipotential cells and so are principally encountered in the gonads. Rarely, teratomas arise from primitive cell rests sequestered in the midline of the body during embryogenesis. In the neoplastic proliferation of these totipotential cells, well differentiated tissues may be produced resembling skin, muscle, fat, g at epithelium, endocrine and exocrine glandular structures, tooth structures. Its true terg to malong origin is often disclosed by a accompanying faci of muscle and cartilage.

The cystic dermoid usually behaves as a benign neoplasm but the solid (non cystic) more vanigated teratoma is frequently malignant. The overwhelming preponderance of neoplasms, however, are composed of one cell type. A classification of the more common forms of neoplasms is presented in table j-1.

Since each tumor tends to have a specific behavior, its specific designation carries important clinical implications. Referring to
the table, one finds that testicular seminiferous epithelium may give rise to either a seminoma or an embryonal carcinoma. Totipotential cells in the testes may also produce a choricarcinoma if tetratogenous development occurred along placental lines.

Given a patient with a testicular tumor, the seminoma represents a form of carcinoma which tends to spread to lymph nodes along the iliac arteries and aorta. These cancers in their primary site tend to be resectable in almost all cases, and the implants in to the abdominal lymph nodes are remarkably radiosensitive and can be cured by irradiation. Very few of these patients die of their neoplasm. The embryonal carcinoma, by contrast, is not radiosensitive, and this tumor has a tendency to invade locally beyond the confines of the testis and to spread throughout the body. Despite all therapeutic efforts, over half these patients are dead within two years of discovery of their neoplasm. The choriocarcinoma in the male is one of the most malignant encountered. Specific terminology has specific clinical import.

It is necessary at this point to bring to attention certain inappropriate usage to deeply ingrained in medical parlance as to be virtually therdicable. For example, malignant tumors arising in liver cells are usually collect hepatomas, although mere properly they should be referred to as hepatocarcinomas. In the same way, the carcinomas arising in melanocytes is generally collect melanoma or malignant melanoma rather than its proper designation, melanocarcinoma. Malignant tumors of lymphoid origin are generically designated lymphomas but all possess varying levels of aggressiveness, and all are malignant in their clinical behaviour. In these instances, innocent terms mask the malignant nature of the neoplasm. Perhaps it is irrational to expect man to be rational.

II. Mixed (More than one neoplastic cell type usually derived from one germ layer)

- Salivary gland
  - Mixed tumor of salivary gland origin pleomorphic adenoma
  - Salivary gland origin
  - Wilms, tumor

Compound more than one neoplastic cell type, derived from more than one germ layer.

- Totipotential cell in gonads or in embryonic rests
  - Teratoma
  - Dermoidcyst
  - One or more element become Malignant.
CHARACTERISTICS OF NEOPLASMS

All neoplasms cause patients to be alarmed, but what comfort the diagnosis "benign from malignant is the most important judgement the pathologists is called upon to make upon this decision are based the therapy of the lesion and the outlook for the patient. Many criteria are used to make such distinction, and the following discussion deals with the general characteristics of benign and malignant neoplasms and particularly those used as differential features.

DIFFERENTIATION AND ANAPLASIA

All tumors, benign and malignant, have two basic components (1) Proliferative neoplastic cells which comprise their parenchyma and (2) supportive stroma made up of connective tissue, blood vessels, and possibly lymphatics. The parenchymal cell are by far the most important, since they not only make up the large bulk of most tumors but also represent the proliferality "Cutting edge" and so determine the nature of the neoplasm.
PART TWO
BIBLIOGRAPHY
1. L185:47257

CARCINOMA, EYE

BILANIUK (LT) and SCHENCK (JF). Ocular and orbital lesions: Surface Coil MR imaging. Radiology, 156, 3; 1985; 669-74.

Nine, lesions, 4 ocular and 5 orbital were evaluated by magnetic resonance surface Coil imaging at 1.5T. Small ocular lesions with 3.9-4.5 mm elevation were demonstrated. The use of 2 different pulse sequences resulted in separation of metanoma from adjacent retival detachment. Contrast obtained between orbital lesions and the adjacent normal structures was better than that demonstrated with high-resolution computed tomography.

2. L185:4725:3

DIAGNOSIS, MALIGNANT TUMOURS, EYE

SAMII (M) and RAMINA (R). Malignant teratoma of the optic nerve: Case report. Neurosurgery. 16, 5; 1985; 695-700.

An unusual case of a malignant teratoma of the right optic nerve with extension into the chiasm is presented. The preoperative diagnosis was difficult to establish. Complete removal of the lesion with postoperative irradation was carried out. Eight months after the operation, the patient developed subarachnoid metastases by metastases and died. No local recurrence of the tumor was seen at autopsy. The therapeutic possibilities for these lesions are discussed.
3. L9C, 185:47257:31

**CLINICAL DIAGNOSIS, CARCINOMA, EYE, CHILD**

A 15 year-old female was evaluated for pain in the region of the right medial canthus and increasing exophthalmos. She had been diagnosed as having pseudo tumor of the right orbit when she was 8 years old. The diagnosis was sustained until a second ophthalmologist requested a CTS can which demonstrated a mucocele of right ethmoid sinus. Intranasal endoscopy revealed medial bulging of the right middle turbinate and meatus. Following a right external ethmoidectomy the eye returned to its normal position and pain disappeared. She has been asymptomatic for the past 4 years.

4. L90, 185:472571:4

**PATHOLOGY, LYMPHOSARCOMA, EYE, ADOLESEN**

A previously healthy 27 year-old man presented with a history of progressive paraplegia and blurred vision within one year. Physical examination revealed marked posterior column sign. Cerebrospinal fluid (CSF) contained a white blood count of 1,940 uL, all lymphocytes. Fundi revealed yellowish in filtration (andle-wase drippings) along retinal vessels and tumefaction of the optic nerve.
head. He was initially misdiagnosed as suffering from tuberculosis was then suspected because of the unusual fundus appearance Malignant lymphoma was conformed by inguinal lymph node biopsy.

5. L185:47257:625
RADIOTHERAPY, CARCINOMA, EYE

AMPIL (FL) and BAHASSA (FS) Primary orbital lymphoma-pseudotumor: Case reports and review of radiotherapy literature. J. Surg. Ocul. 30, 2; 1985; 91-5.

Five case reports of orbital pseudotumor (pseudolymphoma) and primary orbital lymphoma are presented. A review of the literature was conducted in search of differentiating clinicopathologic features suggestive of either condition as well as part of their natural histories. Radiotherapy series reporting beneficial results are summarized.

6. L185:47257:625
RADIOTHERAPY, CARCINOMA, EYE

Irradiation of the orbit is often associated with substantial dose inhomogeneity resulting from the insertion of lens blocks. The authors postulated that such dose inhomogeneity, which often exceeds 40%, could be halved by the
use of two pairs of wedged beams, one angled in the plane and the other in the commonly employed transverse plane. The sagittal plane is obtained by turning the treatment Couch 90°. All beams carried a central-axis lens block and were angled 30° relative to the vertical. Verification of dose distribution was obtained by film dosimetry in a hedd phantom for central- and off-axis places. These measurements indicate that significant improvement in close homogeneity over alternate methods can be achieved with this technique.

7. L18511:47259
CARCINOMA, EYE LIO
Metastatic lid disease is a rare cutaneous occurrence presenting as diffuse lid swelling or a localized nodule. The breast in women, the gastrointestinal and respiratory systems in men constitute the commonest primary sites. Fidspread usually occurs late but may occasionally be the first sign of metastasis. The case of 60 year old man with upper lid retraction secondary to metastatic adenocarcinoma of unknown origin is presented.
8. Li8511:47257
CARCINOMA, EYE LIO

SMITH (SW) and CARRUTHERS (JDA). Intractable periocular hemangioma of infancy. Can. J. Ophthalmol 20, 6, 1985, 220-4

A case of interactable giant periocular hemangioma in an infant is described. This histologically benign but locally invasive tumour is reviewed from the point of view of complications and available treatment modalities. The indications for therapy with a relatively new antifibrinolytic agent, tranexamic acid, are cited.

9. Li8514:47254
MELENO SARCOMA, IRIS, EYE

In a case control study of 212 white patients with primary melanocytic tumors of the iris and two control groups, contingency tables were used to evaluate the distribution of iris colour. The authors found a strong association between light iris color (blue, green, or gray) and the presence of iris melanocytic lesions (p < 0.001 by x^2).
10. L18514:47254

CARCINOMA, IRIS, EYE

GARCIA-ALIV (C) and QUINTANA (M). Teleangiectatic hamartoma of the iris and ciliary body. Ophthalmologica. 191, 4; 1985; 250-253.

Two cases of teleangiectatic hamartoma of the iris and ciliary body are reported, one of them with its histopathological study. No previous cases have been found, as such, in the current literature. The most important descriptions of primary vascular lesions of the iris and ciliary body are briefly reviewed.

11. L18515:47254

MELENOSARCOMA, CHOROID

DeBUSTROS (S) and AUGSBURGER (JJ). Intraocular metastases from cutaneous malignant melanoma. Arch. opthalmol. 103, 1; 1985; 937-940.

In this article authors present a consecutive series of ten patients (12 eyes) with symptomatic intraocular metastases from primary cutaneous malignant melanoma, with emphasis on the variation, in clinical features and extent of intraocular involvement. An investigation of each patients history and the presence of other concurrent metastatic foci help to establish the diagnosis. Palliative radiation therapy may help to control the intraocular metastatic foci and limit the visual loss.
12. L18515:47254

MELENOSARCOMA, CHOROID

A 74-year old woman was found to have increasing proptosis in a blind, painful left eye with neovascular glaucoma. Uveal malignant melanoma with massive orbital involvement was diagnosed, and the patient underwent orbital exenteration, with preoperative and postoperative orbital irradiation. The tumor was a mixed cell, diffuse uveal malignant melanoma with involvement of the optic nerve adjacent to the line of surgical transection and of the optic nerve sheath. Subsequently the cerebrospinal fluid cytology disclosed cells, consistent with malignant melanoma, despite the absence of neurologic signs of symptoms. Cerebrospinal fluid cytology is essential in such cases, and ultrasoundography is of value.

13. L18515:47255:6

THERAPY, MYXOSARCOMA, COROID, EYE

Low-energy \((0.2-0.4W)\) long-exposure \((10-305)\) argon green and brypton red laser applications were used in the treatment of 29 selected choroidal melanomas. In 11 cases laser was used as an adjunct to local surgical resection of the tumour. The technique gives proof of being useful in the management of relatively flat choroidal melanomas of up 4 mm in thickness.

14. L2161:47248

ADENOMA, PARATOIDGLAND

A case of carcinoma arising in a membranous type of monomorphic adenoma of the parotid gland is reported, and the literature is reviewed. This may represent the first unequivocal case of carcinoma ensuing in a nonadenohymymphomatous and nonsebaceous monomorphic adenoma of the salivary gland.

15. L9E,2161:47248

ADENOMA, PARATOIDGLAND, ADOLSCENT

A 69-year-old man who had a 50-year history of recurrent benign pleomorphic adenomas of the Parotid presented with a further recurrence and a skull nodule. Biopsy of the skull nodule was consistent with a metastasis of a benign pleomorphic adenoma.

16. L2161:47257
CARCINOMA, PARATOID GLAND

Two case reports of rare cystic acinic cell carcinoma of the parotid gland are presented, together with a review of the literature. Both cases showed some departures from the classical histological features of acinic cell carcinomas, particularly in reference to the intracystic papillary components. Pure cystic acinic cell carcinomas of salivary gland are rarity in the literature and may appear histologically and morphologically innocuous on superficial examination.

17. L216:47257
CARCINOMA, PARATOID GLAND

This article reports on a high-grade mucoepidermoid tumour with a wide lymphogen and hematogen spread. The patient's further malignomas, a carcinoma of the colon and the urinary bladder, remained without metastases.
18. L2161:47258:3
DIAGNOSIS, ADENOSARCOMA, PARATOID GLAND

A case of a glycogen-rich adenocarcinoma arising in the minor salivary gland of the hard palate is described. The clinical light microscopic, histochemical, and ultrastructural findings supporting this diagnosis are presented.

19. L2161: 47258: 325
MICROSCOPE DIAGNOSIS, ADENOSARCINOMA, PARATOID GLAND

Oncocytomas of the salivary glands on rare occasion, they are multinodular, which imparts a malignant appearance. Only eight such cases have been reported, and an additional case is reported herein. Densecytoplasmic acidophilia an important clue in the identification of the lesion. When this feature is lacking, the lesion may be mistaken for the more aggressive acinic cell tumor. His tochemical stains are not as useful as generally believed. Electron microscopy confirms the diagnosis by demonstrating an abundance of mitochondria. The presence of oncocytic cellular buddings
from the intercalated ducts and ductules surrounding the
tumor and the labular oncocyntic transformation were
important aids in the recognition of multinodular
oncocytoma.

PATHOLOGY, CARCINOMA, PARATOI D
ASAKURA (K) and MORIMOTO (K). Clinicopathological review
Thirty six cases of parotid tumor were treated in the
clinic during the past seven years, 26 benign and 10
malignant. Of the benign tumors, 61% were pleomorphic
adenoma, and 87% of the pleomorphic adenomas were in
female patients. Of the malignant tumors, adenocystic
carcinoma occurred predominantly in females and adeno-
carcinoma in older male patients. Symptoms, X-ray and
CT findings, surgical procedures and end results are also
presented.

CHEMICAL PATHOLOGY, ADENOSANCOMA, PARATOIDGLAND
GUSTAFSSON (H) and KJORELL (U). Cyteskeletal proteins
111, 2, 1985; 99-105.
Oncocytomas and worthin's tumors were studied ultrastruc-
turally and with immunofluorescence microscopic techniques
against cytokeratins, desmin, vimentin, and actin, the latter characterizing myoepithelial cells. The cell types were found within oncocytomas, one type packed with mitochondria and virtually without filaments, the other contained fewer mitochondria but large amounts of cytokeratins. Actin was found only close to the apical cell surface in the cylindrical cells in the Warthin's tumors and around the few acinar lumina found in the oncocytomas; thus a myoepithelial origin of oncocytic tumors of salivary glands seems less plausible.

GAL (R) and STRAUSS (M). Salivary duct carcinoma of the parotid gland: cytologic and histopathologic study. ACTA CYTOL. 29, 3; 1985; 454-56.

Ductal Carcinoma is an uncommon tumor of the salivary glands. Histopathologically, it is characterized by the presence of intraductal and infiltrative neoplastic components morphologically resembling mammary carcinoma. A case of ductal carcinoma of the parotid gland, in which preoperative fine needle aspiration biopses was performed, is presented cytologic examination of the aspirate revealed naked nuclei featuring anisokaryosis chromative clumps and clear vacuolar zones.

COWLEY (J) and TINSLEY (PP Jr). Treatment and prognosis
of mucoepidermoid carcinoma in the pediatric age group.
Arch. Otolaryngol. 111, 5, 1985, 322-4

Although mucoepidermoid carcinoma is the most common
malignant salivary neoplasm in adults, if occurs rarely
in the pediatric age group. A retrospective study of
15 pediatric were 10 to 15 years old, and 11 were female.
The parotid (11/15) and the palate (4/15) were the sites
involved. Tumors were graded into three categories: well
differentiated (grade I) moderately differentiated
(grade II), and poorly differentiated (grade III).
Tumor grade influenced the method and outcome of treatment
Wide local composite resection was used for palatal
tumors, and total dissection was the technique selected for parotid tumors. No nodal or sistant metastases were present in the poorly differentiated tumor category (2115). A follow-up period of ten years or more was possible in 90% of the cases. The progress for these studied is excellent and there have been no deaths attributable to the malignant process.

25. L2161:47258:7

SURGERY, ADENOSARCOMA, PARATOID GLAND

A personal series of 267 salivary tumors seen in a 20 year period was reviewed. Thirty six patients with a previously untreated histologically proven adenoid cystic careinoma of the major and minor salivary glands were submitted to radical surgery. This year survival was 73% ; no patient died of disease or suffered a recurrence of disease beyond the 5-years mark, suggesting that radical surgery achieves good results and largely pre-empts the notorious pattern of repeated recurrence only 8% of the patients died solely of primary recurrence suggesting that the place of supraradical surgery is likely to be very united.

STEMMERMANN (GN) and BROWN (C). A survival study of intestinal and diffuse types of Gastric Carcinoma. Cancer. 33, 4, 1974, 1190-5

This study indicates that women with diffuse carcinoma exhibit better long term survival rates than men with diffuse carcinoma. This difference can be explained by less frequent lymph node metastases in women with diffuse tumors. The known differences in the sex distribution of stomach cancer survival and mortality rates in Japanese as compared with Caucasians, the predilection of diffuse carcinoma to occur the young women, and the differences in survived of men and women with diffuse carcinoma suggest that inherited hormonal and immunologic factors might influence the growth of this tumor.

CARCINOMA, STOMACH

KRAUS (AS) and LEVIN (ML). A study of occupational associations with Gastric Cancer. Amer. J. Publ. Hlth. 47, Aug; 1957; 961-70.
A full and careful occupational history was taken from 56 male patients with cancer of the stomach and from 4 control groups of patients with other disease, totalling 677. So far as possible the groups were matched for age and other factors, and precautions were taken to make the statistical comparison a fair one. The main occupations significantly associated with gastric cancer were those metal industries, including blast furnaces, steel works, rolling mills, and the like, which involved exposure to iron dust. An increased incidence of gastric cancer was, however, found among men exposed to inorganic dust containing free silica one clear relationship which seemed to be almost specific was a remarkable association of cancer of the stomach with polish birth, independent of any occupational factors. This genetic factor has been noted previously in the literature and the method of analysis used in this study gives valuable confirmation of this important observation.

28. L24:47857
CARCINOMA, STOMACH
Three cases of adenocarcinoma of the stomach, two in situ and one superficially invasive, and one of superficially invasive squamous cell carcinoma of the esophagus are presented to illustrate the problems encountered in the diagnosis of early lesions of the upper gastrointestinal tract and the contribution that cytodiagnosis can make. The cytologic findings, with histologic correlation are presented in an effort to define some specific criteria for the diagnosis of early malignancy of the upper GI tract.

CARCINOMA, STOMACH
IWANAGA (Takeshi) and KOYAMA (Hiroki). Diffuse submucosal Cysts and carcinoma of the stomach. Cancer. 36, 2; 1975, 606-14.

Gastric submucosal cysts, carcinomas, and atypical hyperplasia have been observed in the superficial mucosa of 12 stomachs. It is thought that gastritism may give rise to these heterotopic glands, that the development of heterotopic cysts in the submucosa may make the surface mucosa prove to erosion, and the repeated erosion and regeneration may cause carcinoma or atypical hyperplasia.

MACHI (J) and TAKEDA (J). Normal stomach wall and gastric cancer: Evaluation with high-resolution operative
Radiology. 159, 1; 1986; 85-87.
Operative ultrasound examinations were performed using a 7.5-MHz ultrasound during nine operations for advanced gastric cancer and during six for early cancers. Normal stomach wall showed five layers that corresponded to histologic structures. Fourteen of 15 tumors, including non-palpable early cancers, were localized with ultrasonography. In addition, both depth of penetration and lateral wall extension of the gastric cancer were precisely determined with this technique. The preliminary result indicates that high-resolution operative ultrasonography may become a diagnostic aid during gastric cancer operations.

ETIOLOGY, CARCINOMA, STOMACH
LOSCOS (JM) and GUTTERREZ DEL OLMO (A). Cancer of the gastric stump. Gastrointest. Endosc. 32, 2; 1986; 75-7.
28,500 fiberoptic endoscopies were reviewed. 97 cancers of the stump were found in 1,119 patients who had gastric resection (8.66%), in contrast to the 3.9% of cancers of found in nonoperated patients. This suggests that the gastric remnant has a higher tendency to develop cancer than the nonresected stomach. A policy of periodic follow-up of these patients must be considered in order to detect the tumor at an early stage.

33. L24:47257:2

ETIOLOGY, CARCINOMA, STOMACH
The results of surgical treatment of gastric cancer were reviewed retrospectively for 135 atomic bomb survivors and 2.77 control patients. The mean age was significantly higher in the survivors than in the controls. Otherwise, both groups were quite comparative especially in term of the stage of the disease. Histopathologically, the rates of poorly differentiated or undifferentiated types of carcinoma and secondary lymph node involvements were significantly lower in the survivors than in the controls. There were no significant difference between the two groups in postoperative morbidity and mortality rates and long term survival rate. The incidence of second primary malignancies, however, was apparently higher in the survivors than in controls.

34. L24:47258:2

ETIOLOGY, ADENOSARCOMA, STOMACH

This paper provides a valuable review of the distribution of gastric cancer throughout the world and of existing knowledge of the etiology of the disease. It also provided new data obtained from interviews with patients with gastric cancer. In their own study the authors compared
521 patients with gastric cancer from the four countries with 653 control. The common characteristics of areas high in gastric cancer (Japan and Iceland) which distinguished them from the low incidence area (U.S.P.) were a high intake of starchy foods and a low intake of fresh fruits and vegetables. In some areas of high incidence there is a relatively high use of home-smoked or charcoal broiled foods.

35. L24:47258:33
CHEMICAL DIAGNOSIS, ADENOSARCOMA, STOMACH
An autopsy case of primary gastric choriocarcinoma of a 70 year-old Japanese female is presented. The tumor was initially diagnosed as poorly differentiated adenocarcinoma of the stomach by biopsy. Autopsy revealed coexistence of choriocarcinoma and adenocarcinoma in the stomach and a large amount of human chorionic gonadotropin in the serum. The choriocarcinoma metastasized to the liver, lung and omentum, and the adenocarcinoma to lymph nodes. In the gastric tumor, immunohistochemical stains showed human chorionic gonadotropin in choriocarcinoma cells, alphafetoprotein and carcinoembryonic antigen in adenocarcinoma cells. The pathogenesis and pathological characteristics of primary gastric choriocarcinoma are discussed.
35. L24:47258:33
CHEMICAL DIAGNOSIS, ADENOSARCOMA, STOMACH
An autopsy case of primary gastric choriocarcinoma of a 70-year-old Japanese female is presented. The tumor was initially diagnosed as poorly differentiated adenocarcinoma of the stomach by biopsy. Autopsy revealed co-existence of choriocarcinoma and adenocarcinoma in the stomach and a large amount of human chorionic gonadotropin in the serum. The choriocarcinoma metastasized to the liver, lung and omentum, and the adenocarcinoma to lymph nodes. In the gastric tumor, immunohistochemical stains showed human chorionic gonadotropin in choriocarcinoma cells, alpha-fetoprotein and carcinoembryonic antigen in adenocarcinoma cells. The pathogenesis and pathological characteristics of primary gastric choriocarcinoma are discussed.

LISHI (H) and TATSUDA (M). Endoscopic diagnosis of minute gastric cancer of less than 5 mm in diameter. Cancer. 56, 3; 1985; 655-59.
The accuracy of diagnosis by endoscopic visual and histocyto-
logic examination of minute gastric cancers of less
than 5 mm in longest diameter was investigated, 50 minute
cancers were found in 54 patients. Histologic or cytologic
confirmation of carcinoma was obtained before operation in
73% of cases with a solitary lesion, but in only 75 of
case with multiple lesions, for an overall positive result
of 25.5%. The diagnostic rate was higher for elevated type
and depressed type with converging folds than for that
type and depressed type without converging folds. No cancers
of less than 3 mm in longest diameter were correctly
diagnosed before operation. Endoscopic detection and sub-
sequent accurate biopsy of suspicious lesions is very
important for diagnosis of minute gastric cancer.

ALBERTI-FLOR (JJ) and HALTER (S). Multiple gastric car-
cinoids in a patient with history of primary hyperpara-
thyroidish. Am. J. Gastroenterol. 80, 7; 1985; 531-4.
A 66-year old man with a past history of hyperparathyro-
idish was evaluated for chronic epigastric pain. An upper
gastrointestinal X-ray examination revealed the presence
of polypoid filling defects and endoscopy-polypectomy
eventually proved these to be gastric carcinoids.
ETIOLOGY, CARCINOMA, STOMACH

BONAR (SF) and Sweaney (EC). The prevalence, prognostic significance and hormonal content of endocrine cells in gastric cancer. *Histopathology*. 10, 1; 1986; 53-63.

Twenty six of 100 cases of gastric adenocarcinoma contained argyrophil cells. All these tumors were carcino-embryonic antigen positive and 13 contained variable amounts of gastro-enteropancreatic peptides and amines. There was no significant difference in mucin type, extent or incidence of intestinal metaplasia between tumors with and those without endocrine cells. The prognosis for both groups was similarly poor, contrasting with that for carcinoid and atypical carcinoid. Endocrine cells hyperplasia was evident in the adjacent mucosa in some of the cases of endocrine positive tumors. There was no association between achlorhydria and the presence of endocrine cells in the tumors.

SURGERY, CARCINOMA, STOMACH

When compared with a matched population group, 4466 ulcer patients who had had gastric surgery between 1940 and
1960 showed no difference in the risk of death from gastric cancer in the first 20 years of follow-up but a U.S. fold increase thereafter. In duodenal ulcer patients there was an initial decrease in risk followed by a 3.7 fold increase after 20 or more years. Since the initial decrease was seen only in the gastrectomy patients and not in those who had truncal vagotomy and drainage, it may have been due to reduction in mucosal surface. The increased risk 20 years after duodenal ulcer surgery was greater in vagotomy patients than in gastrectomy patients. In gastric ulcer patients a 3.0 fold increase in risk for the first 20 years rose to a 5.5 fold increase thereafter. After 20 years, patients treated with the Bilroth II operation were at high risk than those treated with Bilroth I, consistent with a role for bile reflux in gastric carcinogenesis.

TAKSDAL (S) and STALSBERG (H). Histology of hastedic carcinoma occurring after gastric surgery for benign conditions. Cancer, 32, 1; 1973; 162-6.
Eight-four gastric cancers in patients who had previously been subjected to gastric surgery for benign conditions were histologically classified according to Lauren's method
and compared to gastric cancer in patients with no previous gastric surgery. It is concluded that intestinal and diffuse type of gastric carcinoma both increase in frequency after gastric surgery, but the increase appears to be larger for the diffuse type. Intestinal metaplasia and gastritis were no more prominent in sections from the primary resectates from 16 patients who later developed gastric cancer than in controls. Infiltration of leukocytes was more prominent in carcinomas found in postoperative patients than in carcinomas found in patients not previously operated on.

CAI-JIE (Yan) and BROOKS (JR). Surgical management of gastric adenocarcinoma. Am. J. Surg. 149, 6; 1985; 771-4.

This paper has analyzed the results of surgical management of 196 patients with gastric carcinoma. Surgical technique, operative mortality, and complications, and 5 yr survival were recorded. The respectability rate of the tumor in patients explored was 78.1% and the 5 yr. survival for all 153 gastrectomies was 24.9%. Chronologic comparison over the years showed a decrease in the incidence of cancer of the stomach over the past 55 yr. a steady increase in the 5 yr. absolute survival of patients with gastric carcinoma, and a significant decrease in the operative mortality and an increase in the 5 yr survival after subtotal gastrectomy.
42. L2722:47257
CHARCINOKA, COLON
Two cases of highly malignant tumors, one originating in the sigmoid colon and the other in the rectum, are presented. Both tumors showed light microscopic, electron microscopic, and immunohistochemical evidence of multidirectional differentiation. The tumors were composed mainly of undifferentiated cells, but focally merging into areas with adenocarcinomatous and squamous differentiation. Ultrastructurally and histochemically, a predominant endocrine differentiation was present in the undifferentiated areas of the tumors. These two cases lend further support to the recent concept of a pluripotential stem cell in the mucosa of the gastrointestinal tract capable of differentiation in several directions.

Carcinoma, Colon
Alley (PG) and Mcnee (RK). Age and Sex differences in right colon cancer. Colon Rectum. 29, 4; 1986; 227-9.
In a prospective study of 402 colorectal cancer patients, 133 patients (46 men and 8 women) presented with right colon cancer. There was no significant difference between men and women in right colon cancer incidence. Common presenting features were abdominal pain, weight loss, and
anemia. Ninety-one patients underwent resection with curative intent. There were significantly fewer Dubes' A tumors in the right colon cancer series. Significantly more women in the right colon cancer group were over 79 years old. The findings of peritoneal metastases and poorly differentiated lesions at initial surgery also were associated significantly with women who had right colon cancer. This study confirms previous reports of more advanced tumors in the right colon. The need for age, sex and subsite differences to be taken into account when assessing treatment outcomes or survival is emphasized.

45. L2722-3:4757

CARCINOMA, RECTUM & COLON

To evaluate the potential effect of androgens on human colorectal cancer, the prevalence and concentration of cytosolic androgen receptors were analyzed in 23 rectal and 13 cecal adenocarcinomas by a hybrid radioligand assay. Androgen receptors were detected in nine of the rectal and five of the cecal tumors. Androgen receptor levels demonstrated were low, ranging from three to 17 fmol/mg cytosol
protein. Androgen receptor prevalence was similar in mucosa adjacent to rectal and cecal adenocarcinomas and in mucosa from five of ten patients with diverticular disease. Author's findings suggest that androgen dependency does not play a major role in endocrine control of the development of rectal cancer.

GARDNER (BLRNARD) and FELDMAN (Joseph). Investigations of factors influencing the prognosis of colon cancer. Am. J. of surg. 153, 6; 1987; 1541-4.

This study evaluates groups of colon cancer patients to determine factors affecting survival that are not commonly used in current staging systems. It points out that significant errors can occur in interpreting the results of randomized trials if stratification for these factors is not considered.

47. L2722:47257:7
SURGERY, CARCINOMA, COLON

Is colon cancer surgery justified in the very elderly from the standpoint of cost and 3-year survival rates? Two hundred eighty patients undergoing major surgery for colon
cancer during 1981-3. were divided into a group of 61 with ages greater than or equal to 80 (GE80) and 219 less than 80 (LT80). Although those GE80 had higher median lengths of stays (18 Vs. 15 days, p=0.013) than these LT80, there was no difference 3-years survival curves. Proportional Hazards linear Modal (Multivariate) analysis showed that the risk of mortality could be predicted by disease stage or type of operative required but not by age group. It is concluded that surgery for colon cancer in the veryelderly is justifiable and should not be restricted on the basis of age alone.

SUGARBAKER (RH) and GIANOLA (EJ). Prospective, randomized trial of intravenous versus intraperitoneal 5-fluorouracil in patients with advanced primary colon or rectal cancer. Surgery. 98, 3; 1985, 414-22.

The authors undertook this study to investigate a new route of administering an old drug, 5-flourouracil. Sixty-six patients with advanced primary colon or rectal cancer were randomized to receive 12 cycles with increasing dosages of intravenous (IV) or intraperitoneal (IP) 5-FU; the mean follow up time was three years. The maximal tolerable dose and objective adverse side effects were
recorded. The mean daily dose of 5-FU given by the IV route was 904 mg, for the IP route it was 1361 mg. Two of ten patients had recurrent peritoneal carcinomatosis when treated with IP 5-FU; ten of eleven patients treated with IV 5-FU developed peritoneal implants. It was concluded that if 5-FU is given to patients with gastrointestinal malignancy, the IP route should be strongly considered.

CARCINOMA, RECTUM

MADSEN (PM) and CHRISTIAN (A). Distal intramural spread of rectal carcinomas. Dis. Colon Rectum. 29, 4; 1986; 279-82.

Forty-three consecutive specimens of resected rectal carcinomas, 16 abdominoperineal and 27 anterior resections, were examined for distal intramural spread. Thirty-four of the resections were considered curative and nine palliative. Eighteen carcinomas (42%) showed no distal spread (0.5 mm). In the remaining cases, 11 (25%) had distal spread of more than 5 mm and eight of more than 10 mm. The eight carcinomas with distal spread of greater than 10 mm were advanced Dukes'c tumors. Only three were considered curable. All potentially curable carcinomas would have been resected adequately with a distal margin of only 1.5 cm. except one signet-ring carcinoma with extensive lymph node metastases located in the lower rectum.
50. L2723:47257:3
SAITOH (N) and OKUI (K). Evaluation of echographic
diagnosis of rectal cancer using intrarectal ultrasonic
Ultrasonic examination conducted in order to diagnose
the depth of invasion and local lymph node metastases
of rectal cancer. The intrarectal approach was performed
preoperatively in 99 patients with rectal cancer, using
either an Olympus-Aloka Ultrasonic endoscope or other
probes. Through this method, intrapelvic organs were
detected in all patients. The normal rectal wall was
echogenically divided into five layers, the third layer
being the submucosal and the fourth layer being the
proper muscle layer. In some cases, the proper muscle
layer was divided into three layers in the echogram. In
79 to 88 patients, the diagnosis of depth of invasion,
classified into three groups, was possible. Thus,
intrarectal ultrasonography provides valuable informa-
tion concerning the choice of operating methods for
rectal cancer.

D'ISTRIA (M) and FASANO (S). Androgen and progesterone receptors in colonic and rectal cancers. Dis. Colon Rectum 29, 4; 1986; 263-5.

Androgen progesterone and estrogen receptors were analyzed in 12 primary colonic cancers and 16 primary rectal cancers. Androgen and progesterone receptors were positive in some colonic cancers and rectal carcinomas; however, none of the specimens analyzed showed estradiol receptor.
RADIOTHERAPY, CARCINOMA, RECTUM
CHAN (KW) and BOEY (J). A method of reporting radial invasion and surgical clearance of rectal carcinoma. Histopathology. 9, 12; 1985; 319-27.

Fifty rectal carcinomas resected during a 24 month period were examined by whole-month giant sections. By light microscopy the distance of maximal tumor invasion into the bowel wall and the surgical clearance were measured by a new standardized method. The outer border of the muscutans propria and the line of surgical excision were used as the reference points. Preliminary results suggest that there is a significant inverse correlation between tumor penetration and radial surgical clearance. The adequacy of radial surgical clearance may affect the risk of local recurrence and may prove useful as a prognostic indicator.

MALIGNANT TUMORS, LIVER
PHILLIPS (MJ) and LANGER (B). Benign liver cell tumors. Cancer, 32, 1; 1973; 463-9.

The pathologic features of 15 benign liver cell tumors have been reviewed. Distinctive gross, microscopic and ultrastuctural serve to distinguish two pathologic entities-
Liver cell adenoma and hepatic hamartoma. Both conditions are benign tumors and must be differentiated from primary liver cell carcinoma. Much confusion exists in the terminology applied to these lesions. It is proposed that the term hepatic hamartoma be used for that common focal nodular malformation of the liver that is composed of hepatocytes and biliary epithelial cells, and that the terms liver cell adenoma be reserved for those benign neoplasms composed solely of well-differentiated hepatocytes.

CARCINOMA, LIVER
LINDER (GEORGE T) and CROOK (John N). Primary liver carcinoma Cancer, 33, 6; 1974; 1624-9.

From 1948 through 1970, 164 histologically diagnosed cases of primary liver carcinoma were managed. The disease was five times more in males, and most frequently occurred in the 6th and 7th decades of life. Weight loss, upper abdominal pain, anorexia, and jaundice made the most significant symptom complex. Approximately 85% of the cases were hepatocellular carcinoma. Extrahepatic metastases were present in 55% of the 120 cases which come to autopsy. Lung, regional nodes, adrenals, and bone were the favoured sites. Tumor was limited to one lobe in 32% of cases. Cirrhosis of the liver was diagnosed in 56%. Over all survival data for operated vs. nonoperated cases did not vary significantly. Twenty-seven patients had percutaneous liver biopsy, the death of 3 was directly attributable to intra abdominal hemorrhage after this procedure.
57. L9C,291:47257
CARCINOMA, LIVER, CHILD
Twenty-five personal observations of primary pediatric tumor of the liver are reported and a critical review of the numerous classifications proposed is made. In each group of neoplasia the pathogenetic like between these rare and interesting tumors and viral and chemical factors as well as the relationship with congenital anomalies are discussed. This, together with the histological and ultrastructural patterns, suggest the possible dysembryogenetic nature of this group of tumors.

58. L291:472563
FIBROSARCOMA, LIVER
A case of primary fibrosarcoma of the liver occurring in a 51 year old man is added to 11 previously published cases. The neoplasm was moderately differentiated and occurred in a cirrhotic liver. Review of the literature revealed this to be the 3rd case of fibrosarcoma associated with
cirrhosis. In 4 additional cases of cirrhosis-associated fibrosarcoma, a coexistent primary carcinoma was present in a different part of the same liver.

59. L291:47257:3

CLINICAL DIAGNOSIS, CARCINOMA, LIVER

OHL (S) and REHWALD (U). Evaluation of hepatic calcifications in cancer patients with ultrasonography and computed tomography. *Tumordiagnost*. 6, 1; 1985; 32-36.

Eight patients with metastatic solid tumors had calcified liver metastases. These infiltrates can be demonstrated by pain X-ray pictures, however, they may be differentiated earlier by sonography and computed tomography. Their appearance does not necessarily correlate with the histology or response to treatment. In addition to cases of colorectal malignancy, this unusual finding occurred in association with breast cancer, thyroid and ovarian cancer.

60. L291:47257:4

PATHOLOGY, CARCINOMA, LIVER

Pathological fracture and metastatic bone disease without pulmonary metastases were the presenting features in three patients ultimately found to have primary hepatocellular carcinoma. In one case immunoperoxidase staining of bone scraping for α-fetoprotein secreting cells contributed directly to the diagnosis.

Fifty three patients were evaluated for carcinoma of the extrahepatic bile ducts. This population was retrospectively reviewed and 33 preoperative and postoperative variables were analyzed to evaluate the predictors of increased survival. No preoperative data, including symptoms, admitting laboratory data, or tumor location, predicted increased survival. Whipple resection yielded a median survival of 12 months; palliative resection, 1.5 months and laparotomy, only 5.5 months; these differences were not statistically significant. Experience with six patients treated with internal radiation, plus as much as 4000 rads of external beam irradiation may aid palliation.
62. L291:47257:625

RADIOThERAPY, CARCINOMA, LIVER

MARCHAL (GL) and PYLYSER (K). Anechoic halo in solid liver tumors: sonographic, microangiographic, and histologic correlation. Radiology, 156, 2; 1985; 479-83.

The origin of the sonographic halo sign in liver metastases was studied after autopsy in 33 livers with macroscopic tumoral involvement. For 20 lesions a detailed comparison of findings from high-resolution 7.5 and 10 MHz sonography, microangiography, and histology was carried out. Histologic study focused on the tumor periphery and its relationship to the adjacent liver parenchyma. In particular, the type of tumor infiltration, the presence or absence of peritumoral fibrosis, and the degree of liver cell compression were assessed. In all but two cases the halo was extratumoral and was caused by peritumoral liver cell compression. In the remaining two cases the halo was tumoral and was caused by irregular fibrosis or vascularization.

63. L291:47257:628

CHEMOTHERAPY, CARCINOMA, LIVER

Nine of 11 patients with hepatoblastoma treated with cisplatin (DDP) based chemotherapy had a complete (CR) or partial (PR) remission. Five of these achieved a CR
of pulmonary lesions. The average interval of disease control following was three times that of Admamycin (ADR). DDP is an effective agent in the treatment of hepatoblastoma.

64. L291:47257:628

CHEMOTHERAPY, CARCINOMA, LIVER

Experience of continuous infusion into the hepatic artery of chemotherapeutic drugs in the management of 21 patients with advanced metastatic cancer of the liver is described in this paper. Of the 21 patients 16 were considered to have received adequate treatment, and in 13 of these there was significant tumour regression. Appreciable clinical benefit, however, was obtained by only 10 patients in this group, 8 of whom had a primary growth in the colon or rectum and in the pancreas of the remaining 6 patients 3 died from hepatic coma during or shortly after treatment. With the dosage given significant toxicity were rarely noted. In 9 cases the response to liver function tests become abnormal, but after cessation of treatment liver function improved in most of the cases.
CHEMOTHERAPY, CARCINOMA, LIVER

FALKSON (G) and COETZER (BJ). Phase II studies of mitoxantrone in patients with primary liver cancer. Investig. New Drugs 3, 2; 1985; 187-9.

Forty-nine patients with histologically confirmed primary liver cancer have been entered on phase II trials of mitoxantrone at a dose of 14 mg/m^2 every 3 weeks. Among the patients evaluable for toxicity, leukopenia and thrombocytopenia were the most important side-effects encountered. Partial responses have been observed. In a significant number of patients the disease remained stable for at least 1 month. At present, the response rate and median survival times are similar to those documented with other single cytotoxic drugs, given to comparable groups of patients with primary liver cancer.

CHEMOTHERAPY, CARCINOMA, LIVER

The results of ^201^Ti pre-rectal scintigraphy in 10 patients with primary hepatocellular carcinoma (HCC) were presented together with the findings from contract angiography.
computed tomography and ultrasonograph. $^{201}\text{TI}$ accumulation within the tumor was seen in seven of ten patients. This accumulation was though to be due to $^{210}\text{TI}$ supply not from the portal vein but from the hepatic artery since significantly high heart to liver uptake ratio from 0.71 to 1.21 and clear visualization of heart and kidneys, indicating the presence of abundant portal to-systemic shunting were observed. This finding reveals the evidence of the lack of $^{21}\text{TI}$ supply to the tumour from the portal vein. It seems that HCC does not receive any significant amount of blood flow from the portal system.

CHEMOTHERAPY, CARCINOMA, LIVER, OLD AGE

YANAGA (Katsuhiko) and KANEMATSU (Takashi). Hepatic resection for Hepatocellular carcinoma in elderly patients Am. J. Surg. 155, 2; 1988; 238-41.

Between 1973 and 1985, 27 elective hepatectomies were performed for hepatocellular carcinoma in patients 65 years of age or older. The authors report that 40.7 percent of these patients died in the hospital, mainly due to spsis. They conclude that concomitant systemic disorders and major hepatectomy for patients with cirrhosis were the causes of the high postoperative death rate.
68. L292:4725
MALIGNANT TUMORS, GALLBLADDER

An unusual case of malignant mixed tumor of the gallbladder is reported. Its four microscopic components adenocarcinoma, fibrosarcoma, chondrosarcoma, and os twid are illustrated. Its similarity to malignant mixed tumors of the liver is described. Possible explanations for its origin are presented.

69. L242:4725
MALIGNANT TUMORS, GALLBLADDER

OJEDA (UJ) and SHILKIN (KB). Premalignant epithelial lesions of the gall bladder: A prospective study of 120 cholecystectomy specimens. Pathology 17, 3; 1985; 451-4.

One hundred and twenty gall-bladders obtained at cholecystectomy for gallbladder disease formed the basis of a prospective study of premalignant epithelial lesions. Six cases displayed abnormal mucosa (5%); 4 had a typical hyperplasia (dysplasia) and 2 gall-bladders had carcinoma in-situ; all were associated with chromic cholecystitis and lithiasis. These changes are considered premalignant and are probably precursors of gallbladder
carcinoma. It is possible to predict which patient with chronic gall bladder disease is likely to harbour premalignant epithelial changes. In any event, thorough histological examination of all gall bladders removed surgically is more than justified.

70. L292:47257
CARCINOMA, GALLBLADDER

WEE (A) and LUDWING (J). Hepatobiliary carcinoma associated with primary sclerosing cholangitis and chronic ulcerative colitis. *Hum. Pathol.* 16, 7; 1985, 719-26.

Hepatobiliary carcinomas were found in eight patients with chronic ulcerative colitis (CUC) and primary sclerosing cholangitis or pericholangitis. The tumors were extrahepatic in five cases and intrahepatic in two; in one case the neoplasm affected both liver and gallbladder. The tumors in seven patients were glandular and, sometimes, cystic and papillary in the remaining patient a combined hepatocellular carcinoma and cholangiocarcinoma was found. The latter tumor seemed to arise from regenerative nodules in secondary biliary cirrhosis complicating PSC. The findings of the present study indicate that the PSC syndrome predispose patients for the development of bile duct carcinoma seem to have PSC prior to the development of the hepatobiliary tumor.
71. CARCINOMA, GALLBLAADER

The authors analyzed the records of 22 patients with cancers of extrahepatic biliary passage (EHBP) to understand their natural histories and patterns of failure and to evaluate the effectiveness of various treatments. None of the preoperative investigations consistently defined the entire extent of tumor. Percutaneous transhepatic cholangiography (PTHC) was the most helpful (100%) in accurately defining the site of ductal obstruction. Computed tomography was helpful in diagnosing liver metastases in 53% and primary tumor mass in 23% of patients.

72. DIAGNOSIS, CARCINOMA, GALLBLAADER

The case of a 77 year old woman with a primary sarcoma of the gallbladder is reported, and the literature on the subject is reviewed. The authors pointed out the poor prognosis of this cancer in spite of extended surgical resection or regional arterial chemotherapy. It is admitted that the rare situation allowing a reasonable chance of long-term survival occurs when the diagnosis of
carcinoma is made at histologic examination of gallbladder removed for what was called "simple lithiasis".

73. L292:47257:31
CLINICAL DIAGNOSIS, CARCINOMA, GALLBLADDER
KOZA (A) and YAMAUCHI (S). Primary carcinoma of the gallbladder. Am. Surg. 51, 9; 1985; 529-33.
Sixty-five Japanese patients with primary carcinoma of the gallbladder were treated. Forty-one patients had histologically proven primary carcinoma and the other 24 patients were diagnosed by laparotomy and/or combination of several diagnostic procedures. The female to male ratio was 1.5 to 1. The peak incidence was at the age of 60-69 years for both sexes. Gallstones were found in 53 percent of resected patients and were demonstrated in 58 percent of conresected patients by ultrasonography. Toparotomy was performed on 50 patients and the tumor could be removed in 15 patients. Resection could be done in only one of 18 patients correctly diagnosed. Fourteen of 15 patients who underwent resection had been diagnosed as case of benign lesions. Curative resections were feasible in six of 15 patients. In curative resection cases, the longest survival time was 42 months; and in case of non-curative resection, 26 months. Most of the nonresected patients died with in 6 months with an operative mortality of 16.6 percent. This report reinforces the difficulty in diagnosis and the poor prognosis for patients with primary carcinoma of the gallbladder.
MICROSCOPE DIAGNOSIS, ADENOMA, GALLBLADDER

Three hundred gallbladders from patients with cholelithiasis were examined under a dissection microscope. Sixteen (5%) were found to have what have been called sessile adenomas. They consisted of mixtures of hyperplastic lining epithelium and metaplastic macous glands, and their interstitium often included smooth muscle fibers. Small foci of moderately severe collumary atypism were present in 19% of the adenoma cases, but none had definitive evidence of malignancy. Carcinoembryonic antigen was demonstrated in hyperplastic lining epithelium with or without collumary a hypism in 31% of the cases. Sessile adenomas most likely represent reactive overgrowth and therefore we prefer to term them hyperplastic.

RADIOTHERAPY, CARCINOMA, GALLBLADDER

Twenty patients with carcinoma of the gallbladder (GB-4 patients) received radiation therapy with curative intent. All 20 received 4500-500 rad. in 180-200 rad fractions to the tumor and regional lymph nodes. A 1000 to 1500 rad external beam boost was delivered in 180-200 rad fractions in 10 patients who received external beam alone or concomitant 5-Fluprouracil (5-FU). Three of the four GB patients received a transcatheter boost with 192-Iridium (192Ir) to a dose of 2000-2800 rad calculated at a 0.5-0.1 cm. radius.

76. L292:47257:626
ELECTROTHERAPY, CARCINOMA, GALLBLADDER

Thirty seven patients with histologic proof of cholangiocarcinoma at the confluence were examined by computed tomography (CT) to determine whether this examination is of value in assessment of these patients for surgery and whether there are any features specific to this type of tumors. Thirty two patients showed intrahepatic duct dilatation; six of these showed dilatation of ducts in one only. Eighteeth patients had intrahepatic in the porta hepetic. Two of the lesions in the porta hepatis
and four of the low-attenuation lesion enhanced. A tropy of a lobe was not noted in seven patients. The result of the study show that CT provides useful anatomic information preoperatively but that the appearance are non-specific.

CARCINOMA, PANCREAS

PATCHEFSKY (Arthur S) and GORDON (Gloria). Carcinoid Tumor of the Pancreas. Cancer. 33, 5; 1974; 1349-54.

The clinical, pathologic and ultrastructural findings from the case of a 64 year old woman with a malignant endocrine tumor of the pancreas are presented. Clinically, the carcinoid syndrome was absent. however, elevated levels of blood serotonin and urine 5-HIAA were recorded. Serum insulin, gastrin, ACTH, Cortisone, and aldosterone were normal. Histologically, the tumor was consistent with a carcinoid tumor. Argentaffin stains were strongly positive. Ultrastructurally, a supraclavicular lymph node metastasis contained pleomorphic secretory granules morphologically identical to those of enterochromaffin cell; and carcinoid
tumors of the gastrointestinal tract. Ultrastructural comparison with a pulmonary carcinoid tumor showed both to have identical pleomorphic secretory granules.

CARCINOMA, PANCREAS
CORRIN (B) and GILBY (ED). OAT cell carcinoma of the Pancreas with ectopic ACTH secretion. Cancer. 4; 1973; 1523-7.
The clinical and biochemical findings in the case of ectopic ACTH secretion are reported in detail with particular reference to the disturbances in potassium and sodium metabolism. Biopsy of an hepatic metastasis during life showed no tumor. Subsequent investigations suggested that the growth was an unusually anaplastic pancreatic islet cell tumor. The histogenesis of oat cell carcinomas is discussed and it is concluded that these tumors are not exclusively pulmonary in origin but all may be regarded as having an endocrine derivation.

81. L293:47257:2
ETIOLOGY, CARCINOMA, PANCREAS
The epidemiological trends in the incidence of pancreatic cancer are best explained by occurrence, and changing preva-
lence, of environmental carcinogens which effect the pancreas. Recent studies of pancreatic carcinogenesis in animals have indicated that very specific carcinogens exist whose actions are predictable and definable. Even though there is no definite evidence connecting animal models of pancreatic cancer with the causative factors of human pancreatic cancer, these studies have not only led to a better understanding of the mechanism which may underlie the development of this disease in man, but have also detected groups of individuals who could be at risk and potentially dangerous environmental circumstances. It now seems that enough information is available to form a basis for attempts to limit the occurrence of this, at present, untreatable disease.

82. L293:47257:3

DIAGNOSIS, CARCINOMA, PANCREAS

CA 19-9 serum concentration was determined by an immunoradiometric technique in 130 subjects to evaluate its role in differentiating pancreatic cancer from chronic pancreatitis. Two threshold values were chosen, 17 and 37 U/ml. With the former, sensitivity, specificity and
diagnostic accuracy were 86.7, 62.3 and 49.0 respectively, with the latter 73.3, 87.0 and 60.3%. The receiver operating characteristic curves demonstrated a satisfactory discriminating capacity of CA 19-9 as regards pancreatic cancer and chronic pancreatitis; in contrast, the discrimination was poor for other gastrointestinal diseases, mainly of a malignant nature.

83. L293:47257: 32.

PHYSICAL DIAGNOSIS, CARCINOMA, PANCREAS

Thirty one patients undergoing laparotomy for tumors in the region of the pancreas had both five needle aspiration cytology (NAC) and histological biopsy specimens taken to assess the accuracy of the FNAC technique. There were two false positive results but there were six false negative results following FNAC with only one false negative result of histological biopsy. However, there was sampling bias in favour of histology in each of the five patients with negative FNAC and positive histology; two had metastastatic disease and three had histology repeated because the initial frozen section was negative, two major complications may have resulted from the histological biopsy procedure. It is concluded that five needle aspiration cytology is the ideal method of biopsying pancreatic lesions because of the inherent risk of complications following histological biopsy.
CHEMICAL DIAGNOSIS, CARCINOMA, PANCREAS

ARI-28, an IgGI antibody, stained the membranes of five out of ten human pancreatic tumor cell lines by immunofluorescence techniques. Electron microscopy on RWP-2 cells, stained by indirect immunoperonidase, confirmed a membrane location for the ARI-28 antigen. Twenty-three of the 27 clinical specimens (83%) of formalin-fixed, paraffin-embedded pancreatic cancers tested were positive. Varying intensities of staining were observed and were related to the degree of differentiation achieved by the tumor; poorly differentiated tumors showing the least staining while well-differentiated tumors showed the greatest intensity of staining in a predominantly apical location. Immunoblotting showed that Arl-28 reacts with a 200,000-dalton antigen present in extracts of RWP-1 and RWP-2 cells. This monoclonal antibody may be useful in the classification of pancreatic tumor cells.

SAKAHARA (H) and ENDO (K). Serum CA 19-9 concentrations and computed tomography findings in patients with pancreatic carcinoma. *Cancer* 57, 7; 1986; 1324-6.
Carbohydrate antigen (CA) 19-9 is a new tumor marker, defined by a monoclonal antibody. Serum CA 19-9 concentrations and computed tomography (CT) findings were studied in 55 patients with histologically proven adenocarcinoma, and in 22 patients with chronic pancreatitis. CA 19-9 was useful in 83% of cases for the differential diagnosis between pancreatic carcinoma and chronic pancreatitis, and serum CA 19-9 levels in pancreatic carcinoma were highly related to the size of tumors. Serum 19-9 levels greater than 37U/ml were seen in patients with a tumor of less than 3 cm, 3 to 5 cm, and greater than 5 cm in diameter 13% (1/8), 98% (19/21) and 92% (24/26) of cases, respectively. These results indicated that the measurement of serum CA 19-9 concentrations would be useful in most if not all, cases for the differential diagnosis between pancreatic carcinoma and chronic pancreatitis, and for the evaluation of tumor burden in patients with pancreatic carcinoma.

86. L293:47257:4

PATHOLOGY, CARCINOMA, PANCREAS

CHEN (J) and BAITHUM (SI). Histogenesis of pancreatic carcinomas: A study based on 248 cases. J. Pathol. 146, 1; 1985, 65-76.

Primary pancreatic carcinomas were studied histologically and histochemically, to assess the frequency of ductal
hyperplasia in tissue adjacent to malignant neoplasms.

Hyperplasia in tissue adjacent to malignant neoplasms.

Hyperplasia was divided into four types. All types of hyperplasia were frequently seen in areas adjacent to carcinomas, including ductal, pleomorphic, mucinous, adenosquamous, small and spindle cell and cystadenocarcinomas. In contrast acinar cell carcinoma and microadenocarcinoma were less frequently associated with ductal hyperplasia. The author's study suggest that both papillary and a typical hyperplasia are precancerous lesions, supporting an hypothesis of ductal origin of pancreatic carcinomas.

87. L293:47257:628

CHEMOTHERAPY, CARCINOMA, PANCREAS

FALK (RE) and MOFFAT (FL). Combination therapy for resectable and unresectable adenocarcinoma of the pancreas. Cancer 57, 3; 1986; 685-8.

The current report summarized author's experience with 77 patients with cancer of pancreas treated over 3.5 years. Patients were not assigned to a definite group of therapy, but through the availability of different drugs and different types of treatment several comparable groups have evolved. All patients have received radio frequency hyperthermia and chemotherapy, but in addition some have received selective immune stimulation with one of two
low-molecular-weight compounds. The data show that radio-frequency hyperthermia permits the use of a lower dose of chemotherapy, with an apparent response to treatment. This response is enhanced significantly by the addition of selective immune stimulation. A further, more rigorously defined study will be under taken to confirm this data.

88. L293:47257:628
CHEMOTHERAPY, CARCINOMA, PANCREAS

Twenty-nine patients with advanced adenocarcinoma of the pancreas were treated with a combination of mitomycin-C, 5-fluorouracil, and adriamycin (MIFA III). Four of these patients achieved a partial response, and two achieved a minor response. An additional seven patients had evidence of disease stabilization. The median survival period from initiation of therapy for responders was 13.5 months as compared to 7.6 months for those with stable disease and 3.2 months for nonresponders (P=0.001). Mylosuppression was the primary toxicity. Prolongation of survival was demonstrated in responding patients who had failed prior chemotherapy. The MIFA III regimen is active, well tolerated, and warrants further investigation in previously untreated patients.
CHEMOTHERAPY, CARCINOMA, PANCREAS

KALSER (MH) and ELLENDERG (SS). Pancreatic cancer: Adjunct combined radiation and chemotherapy following curative resection. Arch. Surg. 120, 8; 1985; 899-903.

The efficacy of combined radiation and fluorouracil as adjuvant therapy for pancreatic cancer is suggested by a prospective randomized study. Twenty two patients randomized to no adjuvant treatment and 21 to combined therapy were analyzed. Neither life threatening toxic reaction nor death due to toxic effect was encountered. The study was terminated maturely because of an unacceptably low rate of accrual combined with the observation of increasingly large survival differences between the study arms. Median survival for the treatment group (20 months) was significantly longer than observed for the control group (11 months). Four patients, three in the treated and one in the control group, have survive five years or longer following surgery. The extent of the tumor and initial performance status were significantly and independently related to survival.

MALIGNANT TUMORS, HEART

FYKE (FE III) and SEVARD (JB). Primary cardictumors: Experience with 30 consecutive patients since the introduction of two-dimensional echocardiography. J. Am. Coll. Cardiol. 5,6; 1985; 1465-73
Experience with 30 consecutive patients who had a total of 32 primary cardiac tumors and who underwent two-dimensional echocardiographic examinations. Most of the tumors were arterial myxomas and 30 were identified on echocardiography. Twenty-five patients, including 21 of 22 with atrial myxoma, underwent surgical resection on the basis of the echocardiographic examination, without preoperative angiocardiology. When the morphologic characteristics of the left atrial myxomas were studied statistically in relation to clinical abnormalities, large tumor size was most closely related to the number and type of associated clinical and laboratory abnormalities. The single exception was embolization, which correlated with echocardiographic tumor consistency.

91. L32:4725
MALIGNANT TUMOURS, HEART

Primary cardiac tumors, while uncommon, are not rare neoplasms. They occur in individuals of all ages. A variety of benign and malignant tumors has been described. Presenting signs and symptoms mimic numerous systemic and cardiac disease states. Echocardiography, catheterization and nuclear magnetic resonance techniques are diagnostic tools
available to the physician. Early diagnosis and surgical
intervention are curative measures for many benign cardiac
tumors. Malignant variants are uniformly unresponsive to
treatment.

92. L32:4725

MALIGNANT TUMOURS, HEART

110, 5; 1986, 371-4.

Two thirds of primary tumors of the heart are benign, and
half of the benign tumors are myxomas. Metastatic tumors
of the heart are 20 to 40 times more common than primary
tumors. Metastatic tumors originate mainly in melanomas,
leukemias/lymphomas, and carcinomas, especially of the
lung or breast. The parts of the heart affected in decrease
ing order of frequency, are the pericardium, mycardium, and
endocardium. The clinical diagnosis is suggested by a
patient with cancer and a normal heart who develops any
kind of heat disease that is progressive and unresponsive to
the usual methods of treatment. Irradiation, pericardioc-
tenesis, and injection with chemotherapeutic agents are
affecte in ameliorating symptoms from lymphomas/leuke-
mias of the heart and in pericardial effusions due to
malignant disease.

CARCINOMA, HEART

NISHIDA (K) and KAMIJIMA (G). Mesothelioma of the atrioventricular node. Br. Heart. J. 53, 4: 1985; 468-70.

A patient with Mobitz type 2 heart block caused by a mesothelioma of the atrioventricular node died of a subarachnoid haemorrhage at the age of 33 two years after implantation of a permanent pacemaker. Mesothelioma of the atrioventricular node is rare, and reported cases have all been diagnosed post mortem. Mesothelioma of the atrioventricular node should be considered in the differential diagnosis of heart block in children or young adults. This is the first case to be reported in Japan.
95. L34:47257:31

CLINICAL DIAGNOSIS, CARCINOMA, HEART

Five years or more after receiving cardiac radiation, 41 patients with Hodgkin's disease and seminoma in remission were subjected to echocardiography. The abnormalities detected included pericardial thickening in 70%, thickening of the aortic and/or mitral valves in 28%, right ventricular elevation on hypokinesis in 39%, and left ventricular dysfunction in 39%. In the 23 patients treated by an upper mantle technique with shielding, the incidence of right ventricular abnormalities and valvular thickening was significantly lower than in patients treated with modified techniques. Although no symptoms were attributable to the observed abnormalities, longer follow-up time may reveal important functional implications.

96. L32:41257:32

PHYSICAL DIAGNOSIS, CARCINOMA, HEART

GO (RT) and O'DONNELL (JK). Comparison of gated cardiac MRJ and 20 echocardiography of intracardic neoplasms. Am. J. Roentgenol. 145, 1; 1985; 21-5.

The gross diagnostic factors of intracardiac tumor in four patients imaged by two-dimensional echocardiography (2D echo) and magnetic resonance imaging (MRI) were compared. These cases had left and one had a right atrial
tumor, all histologically identified as myxoma. Crated cardiac MRI depicted the size, shape, and surface characteristics of the tumors more clearly than 2D echo, because MRI provides better spatial and contrast resolution. Depiction of tumor attachment was poor to good with both technique. Both techniques were highly accurate in localizing the tumor and displaying whether it was fixed or mobile. The global field of view provided by MRI allows better definition of tumor prolapse, secondary valcular obstruction, and cardiac chamber size. This study shows that despite its early stage of development, gated cardiac MRT provide superior image quality and is complementary to 2D echo for characterization and diagnosis of intracardiac tumor.

PHYSICAL DIAGNOSIS, CARCINOMA, HEART

PIZZARELLO (RA) and GOLDDERG (SM). Tumor of the heart diagnosed by magnetic resonance imaging. J. Am. Coll. Cardiol. 5, 4; 1985; 989-91.

A case of liposarcoma metastatic to the heart is presented. This is a very rare entity and only 3 prior case reports could be found. Magnetic resonance imaging was successfully used to visualize the tumor. These images compared favourably with a two-dimensional echocardiographic study and postmortem examination.
CHEMICAL DIAGNOSIS, MALIGNANT TUMOURS, HEART

HASKELL (RJ) and FRENCH (WJ). Cardiac tamponade as the initial presentation of malignancy. *Chest*. 88, 1; 1985; 70-3.

Although neoplastic involvement of the pericardium frequently is present postmortem, cardiac manifestations before death are uncommon, and cardiac tamponade as the initial presentation of cancer is rare. In this study, a malignancy was first recognized in eight of 23 patients (35%) who presented with cardiac tamponade. Seven of these eight patients had lung and one patient thyroid carcinoma. The prognosis of these eight patients was poor with seven of eight patient dead with in a mean of seven weeks. Overall pericardial fluid cytology demonstrated a specific diagnosis of malignancy in 14 of 19 patients (74%) Earlier recognition of the possibility of malignancy may allow initiation of appropriate local or systemic treatment to lessen the probability of cardiac tamponade and improve survival. Authors recommend that all patients who present with tamponade have cytology performed in the pericardial fluid, even if malignancy is not suspected initially.

MICROSCOPE DIAGNOSIS, CARCINA, HEART

A case of vaginal hemangiopericytoma in 20-year old woman was studied by light and electron microscopy. The neoplastic cells had round-to-oral nuclei with one or two nucleoli, five chromatin; a foamy, cyanophilic cytoplasm; and an increased cytoplasmic ratio. Light microscopically, the tumor was composed to spindle- shaped or round cells proliferating around vascular spaces. Mitotic figures, necrosis, and hemorrhage were difficult to find. Electron microscopically, the neoplastic cells occurred in clusters, each of which was enclosed by a basal lamina. The cytoplasm contained abundant free ribosomes, flattened elements of rough endoplasmic reticulum, small Golgi apparatus, round or elongated mitochondria, lysosomes, glycogen particles, and sometimes pinocytotic vesicles and bundles of microfilaments with large dense spots. Desmosomes were also seen. In addition the cytoplasmic process of the benign vascular pericytes was directly in contact with the neoplastic cells which had varying degrees of cytodifferentiation. The neoplastic cells in this lesion are consistent with an origin from pericytes, conforming the findings of this neoplasm when it arose in other sites.

PATHOLOGY, MALIGNANT TUMORS, HEART

ONDRIAS (F) and SLUGEN (I). Malignant tumors and embolizing paraneoplastic endocarditis. Neoplasma 32, 1, 1985; 135-40.
A group of 4495 autopsied patients was evaluated. In 1011 (22.5%) of them various malignancies were found. In 20 of these cancer patients (2%) also a nonbacterial versuscus endocarditis was observed. The most serious complication of this paraneoplastic syndrome was central arterial embolization resulting in cerebral and myocardial infarctions. This was observed in 12 patients in a group, in 9 cases of them infarction was immediate cause of death. Fatal complications due to central embolization were seen also in 3 patients who had a malignant disease without symptoms of generalization. The most frequent tumors observed among the autopside patients were adenocarcinomas of the digestive tract (40%). In the group of revealed tumors adenocarcinomas clearly prevailed (70%). in 10 cases (50%) also mucin production could be detected.

LESTULLIC(C) and NICOLOSI (GL). Neoplastic infiltration of the myocardium: In diagnosis and follow-up by two-dimensional echocardiography. Cardiovasc. Ultrasonography. 4, 1; 1985, 55-9.

A patient effected by lymphoma had ECG signs of ischemia. Two dimensional (2-0) echocardiography allowed the authors to diagnose myocardial neoplastic infiltration, while computed tomography suggested pericarditis. On the basis of
2-D echocardiography data, they performed radiotherapy, obtaining complete disappearance of the mass. Both the presence and the disappearance of the mass were detected by 2-D echocardiography and confirmed by direct inspection.

102. L32:47257:628
CHEMOTHERAPY, CARCINOMA, HEART

Sixty-six patients who underwent endomyocardial biopsy for detection of mitoxantrone cardiac toxicity were evaluated. Endomyocardial biopsy was carried out initially after four courses of chemotherapy with increasing intervals thereafter. Endomyocardial biopsy changes consisting of dilatation of the sarcoplasmic reticulum with vacuolization, and myofibrillar dropout are similar to the early changes of anthracycline cardiomyopathy. While there was a slight suggestion of increasing biopsy grade with increasing mitoxantrone dose, no significant changes in cardiac ejection fraction could be associated, regardless of prior doxorubicin therapy. Authors concluded that mitoxantrone does show morphologic evidence of cardiac toxicity; however, the structural changes are minor and are hemodynamically insignificant. Determination of how much mitoxantrone treatment may contribute to the deterioration of pre-existing doxorubicin damage must await the outcome of longer follow-up.

SURGERY, CHONDROMA, HEART

GRAY (IR) and WILLIAMS (UG). Recurring Cardiac Myxoma

Of a series of 14 patients surviving operation for atrial myxoma, two developed signs of recurrence of the tumour. In both cases the patients underwent two further separate operations for recurrent lesions. The time before the second recurrence was nearly 11 years and four and a half years. In neither case did histological examination show malignant change. These two cases of recurrent atrial myxoma, together with four other reported cases, indicated that second recurrence may occur in about 25% of patients with a first recurrence. Multiple foci of tumour growth is probably the explanation for recurrence in most cases.

MALPAS (JS) and BODLEYSCOTT (R). Rubidomycin is Acute Leukaemia in Adults. British Medical Journal. 3 July; 1968; 23-7.

Rubidomycin is the first antibiotic to have some therapeutic effect on acute leukaemia in man. The authors of this paper record their treatment of 22 adult with acute leukaemia with this antibiotic. Rubidomycin hydrochloride was supplied as a microcrystalline powder readily soluble in water. A total volume of 15-20 ml was injected into the luming of a fast-running intravenous saline infusion. Four of the 22 patients had complete remission of their leukaemia and 2 had partial remission. Several other patients became aplastic and thereafter received various forms of maintenance therapy with survival. Discussing their findings, the authors note that cordiotoxicity appears to be dose-dependent and they advise against
using rubidomycin for maintenance therapy they conclude that rubidomycin can induce remission in patients with acute leukaemia.

CELL PATHOLOGY, LYMPHOSARCOMA, BLOOD

MIYAUCHI (Jun) and KELLEHER (Colm A). Effect of three Recombinant growth factors, IL-3 GM-CSF, and G-CSF, on the blast cells of acute myeloblastic Leukemia, main­tained in short-term suspension culture. Blood, 70, 3 (Sept); 1987; 657-63.

The blast stem cells of acute myeloblastic leukemia (AML) respond in cell culture to growth factors by both ery renewal and terminal divisions. Both of these functions have been shown to be stimulated by the recombinant growth factors granulocyto-macrophage colony-stimulating factor (GM-CSF) and granulocyto colony-stimulating facto homologous to human IL-3, was tested on blast-cells and compared with the effects of GM-CSF, G-CSF, and medium conditioned by the bladder cell like 5637. It was found that IL-3 was an effective stimulator of blast renewal and terminal divisions. A graphic method of presenting complex comparisons between growth factors is also included.
Extracorporeal irradiation of the blood (ECI) has been used in the treatment of 5 patients with acute leukaemia. Treatment was with a high dosage administered over a short period of time. The main effect of ECI was to produce a short-lived reduction in the numbers of circulating blast cells. Temporary clinical improvement was seen in one patient. Chemotherapy after ECI did not seem to be more effective than when given beforehand.

The results of the studies of leukocyto kinetics in chronic lymphocytic leukemia were reported from the National cancer Institute, Bethesda, Maryland, have been interpreted in the light of this recent knowledge. Tritiated thymidine, which is incorporated into the DNA of dividing cells, was given as a single dose of
76 uCi/kg body weight to 11 patients with chronic lymphatic leukaemia and 1 patient suffering from malignant disease who was haematologically normal. The amount of radioactivity appearing in circulating leucocytes was assessed at intervals thereafter by means of autoradiography and by liquid scintillation counter measurements on separated cells.

CHONDROSARCOMA, LARYNX

COAKLEY (JF). Primary oat cells carcinoma of the larynx. 99, 3; 1985; 301-3.

A case of oat cell carcinoma of the epiglottis eleven years after radiotherapy to the larynx for squamous cell carcinoma of the vocal cords is presented. There is a 13.5 percent incidence of a second neoplasm in these cases. This is a very aggressive tumor and a combination of surgery, radiotherapy and multidrug chemotherapy appears to offer the best hope of cure. The two-year survival rate is only 8.5 per cent.

113. L42:472562

LIPOSARCOMA, LARYNX

In the author's knowledge only 7 cases of laryngeal liposarcoma have been reported in the English language literature they add an 8th case and review the other 7 cases. Their
presented with a pedunculated mass arising from the left aryepiglottic fold and obstructing both the larynx and pharynx. The lesion has recurred locally 3 times in a period of 4 years. We discuss pathologic findings and management of this patient.

114. L42:47257
CARCINOMA, LARYNX

The clinical and pathologic findings of six cases of combined small cell carcinoma of the larynx are described. This tumor is a subtype of small cell carcinoma in which there is a definite component of oat cell carcinoma (or intermediate all type carcinoma) together with squamous cell carcinoma of adenocarcinoma or both. The neoplasm seems to derive from a common cell with subsequent divergent differentiation into the Kulchisky cells, squamous cells, and/or glandular cells. After histologic diagnosis, adequate evaluation for tumor staging is mandatory. Like pulmonary combined small cell carcinoma, this neoplasm may be best treated with systemic chemotherapy and radiotherapy. The prognosis is similar to that of other subtype of small cell carcinoma of the larynx.
115. L9C, 42: 47257

CARCINOMA, LARYNX, CHILD

Laryngeal granular cell tumor in childhood is rare. This article describes its occurrence in a 14-year-old girl. A review of the literature revealed five other cases. Clinical, endoscopic, histopathologic, and therapeutic considerations are discussed and compared with those in the adult form of granular cell tumor. Although this lesion is rare, awareness of it is necessary to avoid overtreatment.

116. L42:47252:325

MICROSCOPE DIAGNOSIS, CHONDROSARCOMA, LARYNX

Chondrosarcoma is an uncommon cartilaginous tumor of the upper respiratory tract, and its morphology and clinical course vary widely. Few reports have evaluated the clinicopathological findings of this tumor in the larynx. This paper reports on a low-grade chondrosarcoma in a 44-year-old woman who required laryngectomy for cure. The gross pathological, histological and electron microscopic features of the tumor are analyzed with respect to its clinical course, using histopathological criteria.
X-RAY DIAGNOSIS, CHONDROSARCOMA, LARYNX

Computerized tomography is the imaging method of choice for evaluation of neoplastic involvement of the larynx. There are unusual primary neoplasms of the larynx, which include chondroma and chondrosarcoma. These lesions may cause vocal cord paralysis and respiratory symptoms secondary to compression of the recurrent laryngeal nerve. The authors present a single patient with computerized tomographic imaging of laryngeal chondrosarcoma resulting in unilateral vocal cord paralysis and hoarseness.

SURGERY, CARCINOMA, LARYNX

GREGOR (R Theo) and HAMMOND (Kate). Framework invasion by laryngeal carcinoma. Am. J. Surg. 159, 4; 1987; 452-8.

In this study, framework invasion was associated with osteoblastic activity, which appeared to be at least partially mediated by tumor-produced albaline phosphatase. Osteoclastic activity occurred hand in hand with the former process and at this stage, tumor remained outside the perichondrium. Tetracycline labeling confirmed active
bone deposition in these areas and appeared to explain
the finding of increased ossification seen on computeri-
zed tomography scans.

MORGAN (At) and NORRIS (JW) Palliative laser surgery for
melanoma metastatic to the larynx; Report of two cases.
Laryngoscope. 95, 71; 1985; 794-7.

Melanoma metastatic to the larynx is an extremely rare
entity. This paper describes two patients previously
treated for autonomic melanoma who developed recurrent
melanoma involving their larynges. Surgical excision of
these lesions was accomplished with the carbon dioxide
laser. Apparently these two patients are the first reported
cases of successful management of melanoma metastatic to
the larynx using laser surgery.

The paper also discusses the evolving history and diag-
nosis and of laryngeal melanoma, the use of the carbon dio-
oxide laser in the treatment of other laryngeal and tracheo-
bronchial lesions, the incidence of cutaneous and mucosal
melanoma of the head and neck, and the diagnostic evalua-
tion and management of melanoma.

CARCINOMA, LUNG.

Tumour metastases of the pancreas are rare but recognised causes of acute pancreatitis; there is a 24–40% incidence of pancreatic involvement from small cell lung cancer in autopsy series but only a very few cases of tumour induced, acute, pancreatitis have been described. Chemotherapy has been advocated as the primary therapy in patients with known oat cell carcinoma who develop acute pancreatitis. Author describes 2 patients with acute, haemorrhagic pancreatitis in association with disseminated small cell carcinoma but without evidence of tumour invasion in the gland and with gall stones present in the gall bladder. Chemotherapy would have been inappropriate therapy for these patients.
CARCINOMA, LUNG
MORGAW (A D) and MACKENZIE (D H) clear cell Carcinoma of the lung journal Pathology and Bacteriology. 87;1963;25-7
The simplest classification of bronchial, Carcinoma is that which recognises 4 types- Squamous, Oat Cell, advance Carci­noma, and a group variously termed anaplastic, Polyganal cell, or undifferentiated in a revised of 380 lung cancer of rejected, at 62 there were 10 which were different to assign to any of these categories, the tumour consisting in whole or in part of sheety of clear cells at first suggestive of a metastatic from of renal carcinoma. These are described together with 3 similar cases diagnosed from biopsy specimen. All 13 tumour were in males ranging in age from 41 to 67 year. Retrospective histochemical studies indicated that the clear called appearance of the tumour was due to mucin.

DIAGNOSIS, CARCINA, LUNG
BRETT (G 2 ) , Earlier diagnosis and survival in lung cancer .

In a controlled investigation, the survival prospects of lung cancer in the population of new aged 40 and over. The 5 year survival rate in the lung cancer in the study series was 15% and in cases discovered by 6 monthly examination 23% compared with 6% in the control series. The average expectation of life after diagnosis, was 25 years for the last cases and 1.2 for the control cases. Survival declined with age of resected lung cancer 32% survival 5 years in the last series and 23% in the control series on the basis of these result it is concluded that through earlier radiological detection a modest improvement in the prognosis of lung cancer can be acheived.

MICROSCOPE DIAGNOSIS,CARCINOMA,LUNG

Periodic screening of high risk persons with sputum cytologic studies and chest radiography can detect nearly lung cancer. The intrathoracic extent of lung cancer can be determined by chest radiography followed by computerized tomography to evaluate the tula, mediaslynum, pleara, and chest wall the author report that a radiologic worked for assessing distant metastases should be performed only when clinical or biochemical finding suggest metastases . They belive that for sensitive than routine radiography.
X-RAY DIAGNOSIS, CARCINOMA, LUNG

The method for the differential diagnosis of small "coin lesions" in the lung is described in this paper. To obtain secretions direct from a peripheral lesion a tetras catheter is inserted into the trachea by the method used for bronchography and is than guidance to the segmental bronchees draining the lesionon the under television fluoroscopy. A very small hylon brush on the end of a long spiral wire is then inserted beyond the end of the catheter. After removed of the brush selective bronchography may be carried out through the catheter.

The method was used in 29 patients with coin lesions. Cyto logical examination of the smears, relected, malignant, cells in 13 of the 14 patients who were later found to have lung cancer.

X-RAY DIAGNOSIS, CARCINOMA, LUNG

POSNER (E) and McDOWELL (L A) Place of mass Radiography in relation to lung cancer in men. British medical journal 2, Nov. 2; 1963: 1156-60.

In an attempt to asses the value of mass radiography in the detection of cancer of the lung the authors have feisewed 1, 523 such cases dio covered by mass X-ray units of the Birminoyham regional hospital Board. These were divided into 2 groups accordingt to whether the diagnosis was made. In the routine sur-
routine surveys. The authors consider that orthodox routine mass radiography can not to any significant extent improve the finding of cases with a favourable prognosis.

129. L45:47257:411

CELL PATHOLOGY, CARCINOMA, LUNG

In the authors new it is not generally appreciated that cyto logical examination of sputum will sometimes identify lung carcinoma in the absence of any detectable radiological change and occasionally, when carcinoma is not suspected clinically the authors, draw attention to the difficulty of findings the early and radiologically invisible growth. They makes following suggestions for the management of such cases.

Cytological diagnosis must be unequivocal and confirmed at examinations of at least two different specimens. Case must be taken to rate out carcinoma of the hasopharynx, month, larynx and esophages, cycle a potential somra of exfoliated cancer alls in the sputum.

130. L45:47257:44

SPUTUM PATHOLOGY, CARCINOMA, LUNG

In the an attempt to assess the value of routine cytological
examination of sputum in the diagnosis of cancer of the lung. The authors examination 1,671 samples of sputum from 541 patients. Among them were 229 patients with a confirmed diagnosis of carcinoma of the bronches, 10 with some other pulmonary malignant disease and 302 with diseases other than cancer. Two separate wet preparation work examination by 2 pathologists independently. One or both observes found cancer cells in the first sample examined in 301% of cases of carcinoma of the bronchy of the 302 patients considered not to have cancer, Cancer cells were found in the sputum of 12 of whose 3 were later show to have carcinoma of the lung. It is concluded the examination of the sputum for cancer cells can be most helpful in cases of strong presumption of lung cancer but in which bronchoscopy has been unsuccessful or is deemed undesirable."

131. L45: 47257 : 625

RADIOThERAPY, CARCINOMA, LUNG

The authors have studied necropsy material from patients treated by Megavoltage therapy for primary lung cancer. The purpose of the study was to establish whether conventional dosages are capable of destroying lung cancer. The findings in 67 histologically varified cases of inoperable lung cancer treated by megavoltage therapy and examined at necropsy 2-49 months later and reported, 46 of the patients were treated by 33 MV Photons
and 21 by a 3,000 60co unit. Tumour doses was usually 4,500 to 5,500 rads in 5-8 weeks, 38 patients had split course and 29 continuous therapy. The results are discussed in detail. The authors feel that sing 30% of the patients had their carcinoma sterilized by radiotherapy, the greatest problem in the treatment of carcinoma of the lung is its readiness to form metastases.

132. L45:47257 : 628

CHEMOTHERAPY, CARCINOMA, LUNG

LASER (J) and SCULIER (J P) Combination chemotherapy with adnamycin, etoposide and cyclophosphamide for small cell carcinoma of the lung. Cancer 56,1,1985;71-75.

The current study reports the results of Adriamycin edoxorubicin, etoposide, and cyclophosphamide (AVE) in small cell bronchogenic carcinoma. The overall rate of response was 82% in patients with limited disease and 66% in patients with extensive disease, complete remissions have been achieved in 20% of the patients with limited disease and in 7% of these with extensive disease. The median duration of survival was 14 months in patients with limited disease and 8.3 months in those with extensive disease. The results and the analysis of literature suggest that survival rather than response should be used to compare studies of chemotherapy in small cell bronchogenic carcinoma.
CARCINOMA, KIDNEY

CAMERON EMMOTT (R) and RICHARD HAYNE (L). Prognosis of penal cells carcinoma with venacava and renal wein involvement. J. Surg. 154, 1987; 49-53.

In tumour surgery vascular invasion usually protends a grave prognosis, however, in patients with renal cell carcinoma, aggressive however management tan acheive survival rates app­ roaching those of cantained hyperhephroma. In the autho's openion orteriography and subsequent radiography of the venacovain theose suspected of having tumour thrambas in the renal or venacava, or both , they think that arteriographic studies are more sensitive and reliable for assessment of vascular thua sion than computerized tomography. The authors conclude that proper preoperative evaluation to diagnose vascular invasion with allow a carefully planned combined urologic and vascular urological tumour, while avoiding tumour thromboembole during resection.

CARCINOMA, KIDNEY

MALONE (M J ) and JOHIWSON (F R). Renal angiomcy olipona 6 case reports and literature review. J. Urol 135, 2, 1986; 349-53.

The authors report 6 cases of renal angiomyslipomas and review the preliment literature concerning this disease. One case involved the pare association of tuberous sclerosis and pre-
pregnancy. Author patient without tuberous sclerosis had renal cell carcinoma and later suffered a contralateral angiomyolipoma. The pathological conditions of renal angiomylipomas with and without tuberous sclerosis are discussed.

Since angiomyolipomas present with multiple clinical similarities to renal cell carcinoma, the primary task for the clinical is to differentiate this hamartoma from carcinoma. The distinguishing characteristics and the clinical management of renal angiomyolipomas are discussed.

135. L51: 47257

Carcinoma, kidney

Differential diagnosis between acinic cell carcinoma and renal cell carcinoma is and often quoted problem. A case is presented of a 60 years old woman with metastatic lesions from a renal cell carcinoma of the parotid as well as the submandibular gland. Appropriate diagnosis was delayed due to lack of clinical information.

NAKAMURA (Y) and NAKASHIMA (N). Bilateral cystic hepato blastemas and multiple malformation with trisomcy 8 mosai­ cism. HUM Pathol 16, H, 1985; 754-6.

The case of 16 month old female infant with bilateral cystic hepato blastomas, Oandy-walker syndronem microcephaly, bilateral cataracts and cerebellar heterotopia is rep­ orted. The patients older siste, who had bilateral cystic hepato blastomas, batryoid sarcoma involving the vaging and curinary bladder, microcophely archineneephaly, and bilateral cataracts, was described in a previous report. Chro­ mosomal study in the present case confirmed trisomy 8 mosaicism. The familiar occurrence and the chromosomal disorder suggest a syndrome involving genetic abnormalities.
Carcinoma, Adrenal gland, Widney

ROBEY (EL) and SCHELLHAMMER (PF) adrenal gland and renal cell carcinoma: Is ipsilateral adrenal ectomy a necessary component of radical nephrectomy? J. Urol. 135, 3; 1986; 453-5.

Authors reviewed retrospectively 44 patients with stage A and B patients with stage B renal cell carcinoma, 25 of whom had undergone ipsilateral adrenalectomy. The 5 year and 9 year survival of these 25 patient was 79 and 65 % respectively, and was not statistically different from the 78 % 5-year and 9 year survival of those 27 patients who did not undergo ipsilateral adrenalec­
tomy. These findings suggest that the ipsilateral adrenal gland head not be removed routinely as part of penfascial nephrectomy for renal cell carcinoma. Those patients who are found to have a contralateral adrenal lesion during preoperative evaluation should be spared bilateral adrenalectomy if there is no ipsilateral adrenal gland involvement at exploration.

Diagnosis, Carcinoma, Kidney

Two cases of renal tumor presenting diagnostic difficulties are reported. In one case, fine-needle aspiration biopsy from a large neoplasm yielded only oncocyttes but histologic examination showed also islets of renal cell carcinoma. The tumor caused pain and computed tomography demonstrated in homogeneity of its inner composition. In the second case there was a silent, small neoplasm, and both cytologic and histologic specimens showed a mosaic pattern of renal cell carcinoma and oncocyttes. The diagnostic difficulties are discussed on the basis of these two cases and reports in the literature.

Clinical Diagnosis, Carcinoma, Kidney

WAGLE (DG) and MOORE (RH). Primary Carcinoma of the renal pelvis Cancer, 33, 61; 1974; 1942-8.

Primary carcinoma of the renal pelvis is believed to represent nearly 8% of all malignant renal tumors. The clinical problems of this tumor have been a continuing challenge to early diagnosis and successful therapy. The present experience of 78 cases using the classification of Grabstald showed there is a significantly direct relationship between the tumor stage
and the tumor grade of these cases, 39.7% manifested bladder malignancy, 38.6% had ureteral tumors. The long term results using post operative radiation as well as various chemotherapeutic agents or both are presently not encouraging only 10.3% of cases had known occupational exposure to various known carcinogens.

Clinical Diagnosis, Carcinoma, Kidney

WATERS (DJ) and HOLT (SA). Unilateral simultaneous renal angiomyolipoma and oncocytoma J. Urol. 135, 3; 1986, 568-70.

A 70 year-old women with simultaneous unilateral renal angiomyolipoma and, end on cocytoma presented to the hospital with syncope and abdominal pain. Diagnostic studies indicated a left renal neoplasm consistent with renal cell carcinoma and a radial nephrectomy was performed. Histological examination of the resected specimen demonstrated the presence of the 2 unusual renal neoplasma.
Microscope Diagnosis, Carcinoma, Kidney

The findings in a fine needle aspirate of a psoas area metastasis from a mixed adenosquamous carcinoma of the renal pelvis are presented. The primary renal tumor is apparently the fourth such case reported in the literature; the pathogenesis of such tumor is briefly reviewed. The value of fine needle aspiration in excluding a clinically suspected abscess and in allowing a diagnosis of malignancy is emphasized.

Clinical Pathology, Carcinoma, Kidney

The effect of lectins on cultured renal cell carcinoma and normal renal cells was studied. Ricin II showed effective inhibition of \(^{3}\text{H}\) - Uridine and \(^{3}\text{H}\) - thymidine uptake by renal cell carcinoma and normal renal cells in all cases. Normal renal cells were more resistant to the inhibitory effect of ricin II as compared to
renal cell carcinoma. Concanavalin agglutinin and wheat germ agglutinin led to stimulation of $^3$H-Uridine and $^3$H-Thymidine uptake by renal cell carcinoma and normal renal cells at low concentrations (0.2 ug/ml), and to suppression at high concentration (2 and 20 ug/ml).

Chemotherapy, Carcinoma, Kidney

A series of monoclonal antibodies (Mabs) to human renal cell carcinoma (RCC) material was developed. Two mabs (D5D and ACH) that showed especially restrictive reactivities were radiolabeled with iodine 131 and tested in nude mice bearing human tumor xenografts for their ability to specifically localize RCC. Extensive studies of tissue radioactive uptake indicated that these mabs could specifically localize RCC tumors with some mice achieving high tumor blood ratios ranging from 15 to 60. Finally, preliminary results indicate that larger intravenous doses of radiolabeled RCC mabs were effective as radioimmune therapy in inhibiting RCC Xenograft growth. Mabs can be produced that
are highly restrictive to human RCC and may be useful clinically for radioimmunoscintigraphy of therapy.

Surgery, Carcinoma, Kidney

PUGLIONISI (Aureliano) and PICCIOCHI (Aurelio). Surgical Approach to Renal cell Carcinoma Extending into the Right Atrium through the Inferior Vena Cava. International Surgery 70, 2; 1985; 159-64

Successful management of a patient with an intracardiac tumor thrombus of renal carcinoma is described. This case and a few others in the literature have led us to consider the clinical signs of cavo-arterial obstruction, frequently silent and unspecific, the diagnostic methodology, especially based upon CAT Scan and Cavography, and the type of surgery and surgical technique called, for especially as regards the approach and the possible use of extracorporeal circulation (ECC).

145 L 51 : 47257 : 7

Surgery, Carcinoma, Kidney

The results of the surgical management of 28 patients with renal cell carcinoma extending into the inferior venacava have been analyzed; 8 patients had caval tumor thrombus extension at the level of the renal veins, 14 had infrahepatic, 5 retrohepatic and 1 arterial tumor thrombus extension. The caval wall was infiltrated by tumor in 7 cases, 9 patients had metastases. Lymphnode involvement was seen in 9 patients. The patients with caval involvement alone (NO MO) had a 2 year survival rate of 69%. Those with distant metastases or caval infiltration had a 2 year survival of 27 and 0% (P = NS). The level of caval tumor thrombus extension had a statistically insignificant influence on the survival of patients. Author's statistical data demonstrate that caval involvement has a very negative impact on the prognosis of patients with renal cancer.

Carcinoma, Ovary

RICHARDSON (George S) and SCULLY (ROBERT E). Common Epithelial Cancer of the ovary. The New England Journal of Medicine, 312, 7; 1985; 415-28.

The most important element of progress in the conquest of epithelial ovarian cancer would be the discovery of a means of prevention. Epidemiologic studies have so far yielded only a few hints, the partial protection
afforded by pregnancy a oral contraceptive medica-
tion, the possibility of reducing the incidence of the
disease by vaccination against mumps or by avoiding
of the use of talcum on the perineum, and closer sur-
veillanl of women with positive family history. Ultra-
sound may be a help ful supplement to pelvis examination
in some postmenopausal women considered to be at risk,
and prophylactic oophorectomy can be considered and
discussed with patients over 40 years of age if a
pelvis operation is being considered.

Malignant tumours, Overy
TOKUOKA (S) and AOKI (Y). Mixed germ cell - sex cord
stromal tumor of the ovary with retiform tubular struc-
ture. A case report. INJ. J. Gynecol. Pathol. 4, 2;
1985; 161-70.

An unusual mixed tumor of the ovary in a 7-month
old girl with a normal 46, XX bayotype, is presented.
The tumor was composed mainly of small epithelial cells
of sex cord type, but also contained multiple foci in
which the presence of large cells resembling germ cells
warranted the diagnosis of mixed germ cell-sex cord-
stromal tumor. An additional histologic feature was
the present in the fibrous stroma of the tumor of tub-
ules of tern. These histologic features suggested that
the tumor was a variant of the mixed germ cell-sex cord
stromal tumor of the ovary.

Carcinoma, Ovary

ROBBOX (Stanley J) and SCULLY (Robert E). Strumal carcinoid of the ovary. An analysis of 50 cases of a distinctive tumor composed of thyroid tissue and carcinoid. Cancer. 46, 9-10; 198; 2019-34.

Strumal carcinoid of the ovary is a type of germ-cell tumor characterized by an intimate mixture of thyroid tissue and carcinoid. Fifty patients with this type of tumor ranged in age from 21 to 77 years. The tumor measured up to 26 cm in diameter and were always unilateral. In 10% of the cases the contralateral ovary contained another type of neoplasm, usually a dermoid cyst. Three fifths of the strumal carcinoids arose in dermoid cysts or in mature solid teratomas. 31% of the tumors were accompanied by focal stromal luteinization, only 8% of the cases exhibited clinical signs of steroid hormone production. In 8% of the cases there was evidence suggesting functioning of the thyroid component; but no patient had the carcinoid syndrome.
Pregnancy, Carcinoma, Ovary

TCHABO (Jean-Gilles) and STAYCELLS (Worth J). Ovarian tumors in Pregnancy. A community Hospital's five year experience. *International Surgery*. 72, 4; 1987; 227-9.

Ovarian tumor in pregnancy is a distressing problem for the obstetrician. A physician must differentiate between a manifestation of a normal physiological condition and a serious pathological condition. Fortunately an ovarian tumor in pregnancy is rare. Once the condition is suspected, a physician should use all available tools to confirm the diagnosis. A patient should be treated accordingly, keeping in mind the age of the patient, the gestational age, and the biology of different types of the tumor.

Pathology, Malignant Tumours, Ovary

A 46 XY women with a dysgerminoma and gonadoblastoma is described. Both dysgerminoma-gonadoblastoma and mixed germcells-sex stromal tissue was present upon microscopic examination. This case exemptifies the transition that can exist between these two distinctly separate tumors.
Physical Pathology, Carcinoma, Ovary

The usefulness of ultrasound diagnosis during polichemo therapy for ovarian cancer is valued. Between sept. 1980 and Mar. 1983, 32 patient with ovarian cancer underwent polichemotherapy, had an ultrasound follow up Ultrasounds are very important for selecting the patients who must undergo second look.

Therapy, Carcinoma, Ovary

Treatment by removal of the effected ovary is appropriate for patients who wish to preserve child bearing function and have unilateral stage I borderline or Grade I ovarian cancer, but total hysterectomy with bilateral salpingo-oophorectomy is appropriate for most patients. Adjuvant therapy may be important for patients with high-grade tumors or cytopositive ascites even through careful exploration reveals no metastases and surgical resection appears to be complete, but
currently it is difficult to choose a type of treatment that does not involve considerable toxicity or lead to late onset leukemia, patient with minimal stage III disease of histologic grade I or higher and those with small residual tumor deposits constitute the group that should be targeted for vigorous therapy aimed at cure.

Radiotherapy, Carcinoma, Ovary

MAUS (JH) and MACKAY (EN) Cancer of the ovary: A twenty one year study of 1,722 patients. American Journal of Roentgenology, Radium Therapy, and Nuclear Medicine, 102 March, 1968.

The authors present a review of the records of 1,722 patients came for radiotherapy for cancer of the ovary. At the 5th anniversary of starting treatment 25% were alive and apparently cancer free, 3% were alive with cancer or with "condition unknown" 3% had died from other causes, and 2% were untraced. Treatment in General consisted of panhysterectomy followed by external radiotherapy. When surgical removal of all gross disease was possible the survival rate showed improvement. It is the author's impression that radiotherapy has added to the efficacy of surgical treatment in late cases.
CHEMOTHERAPY, CARCINOMA, OVARY

The incidence of pulmonary embolism was examined in a series of 83 patients who had received chemotherapy for advanced ovarian cancer and ten embolic episodes occurred. The incidence of pulmonary embolic was highest in those patients who had gross bulk disease (10 cm diameter) before chemotherapy and occurred in 9/49 cases with six fatalities being in this group. Five of the six fatal emboli occurred within 1 week of the first course of chemotherapy. As the mortality rate from pulmonary emboli in patients with gross bulk tumor was 12% in this series, anticoagulation before initiating chemotherapy is suggested for this group of patients.

CHEMOTHERAPY, CARCINOMA, OVARY

Ten patients with ovarian carcinoma whose tumors had progressed on first trial chemotherapy were treated with cisplatin, vinblastine, and bleomycin (PVB) to determine the efficacy, dose range, and toxicity of this combination. Two dose levels of vinblastine were used, objective responses occurred in 5/10 patients, with a median response duration of 170 weeks. Toxicity was appreciable. One patient expired of bleomycin-induced pulmonary fibrosis with the higher dose of vinblastine, for patients had grade III and three had grade IV hematologic toxicity. At the lower dose, two
patients had grade II and one patient had grade III hematologic toxicity.

PVB has activity in second trial therapy of ovarian carcinoma at the dose and schedule tested, but the role of this regimen in the future treatment of this disease remains to be determined.

COMBINATION THERAPY, CARCINOMA, OVARY

Ullrich(D) and GRIMM (D) Treatment of ovarian cancer with combination of operative, radiation and chemotherapy. J.Gynacol. 107, 1, 1985, 628-33.

It is reported about significant results of two years of the combined ovarian cancer treatment in contrast to operation and chemotherapy. Author's therapy is the combination of operation, great field radiation technique, chemotherapy and second-look operation. The remission of two years; stage I: 64%, stage IV no improvement can be achieved by addiction of the radiation therapy.

CHONDROSARCOMA, UTERUS

DARBY (AJ) and PAPADAKI (Lucienne). Unusual Leiomyosarcoma of the uterus containing osteoclast-like giant cells Cancer. 36, 2, 1975; 495-504.

An unusual variant of a poorly differentiated biomyosarcoma of the uterus, containing osteoclast-like giant cell, in described. Areas of the resected tumor bore a close resemblance
to giant cell tumor of bone. It is postulated that these giant cells, as well as the osteoclast-like giant cells reported in number of tumors of other tissues originate from the monocyte/histocyte grouped of cells. The ultrastructural features are consistent with a smooth muscle origin of the neoplasm, the final assessment is based on the relative proportions and frequency of such structures as bundles of myofilaments with focal densities, pinocytotic vesicles and an external lamina.
Carcinoma, Uterus

KAVANAGH (J.J) and COPELAND (L.J.) continuous-infusion
vinblastin in refractory carcinoma of the cervix; A phase
III trial. Cyhecol. Oncol. 21, 2; 1985; 211-4.

Twenty patients with recurrent or metastatic squamous
cell carcinoma of the cervix were treated with continu­
ous-infusion unblastbine sulfate. Two patients (10%) had partial response of 4 and 7 months duration. Neutro­
penia was dose limiting vinblastine sulfate given by
continuous infusion has limited activity in this malig­
nancy.

Carcinoma, Uterus

FUJIMOTO (I) and NEMOJO (H) . Epidemiologic study of
carcinoma in site of the cervix J. Reprod. Med. 30,
7; 1985; 535-40.

From 1950 to 1979, 1, 248 cases of cancer in situ
were treated. Detailed Data were obtained from 585 of
the patients by interview. Many patients had had their
first sexual experience at an early age. Many had had
more than two sexual partners, and there was a large
discrepancy between the age at first sexual inter­
course and at first marriage. The above factors
seem to be related to the development of cancer in situ.
A case of a stromal sarcoma in a cervical polyp is presented. The tumor was confined to the polyp as evidenced by the histological examination of the uterus and cervix after surgery. In spite of that the patient died of widespread abdominal metastasis 1 year after the initial diagnosis.

One hundred cases of stage IB cervical carcinoma treated with radical hysterectomy and pelvic lymphadenectomy. Eight patients were found to have tumor stromal eosinophilia in their peripheral smears. Statistical analysis did not reveal a significant recurrence rate in patients with either peripheral or stromal eosinophilia.
Adenosarcoma, Uterus

CHEN (K T K). Rhobdomyosarcomatous uterine adenosarcoma. INT. J. GYNECOL. Pathol, 4, 2; 1985; 146-52.

A case of rhabdomyosarcomatous adenosarcoma of the uterine cervix is described and the literature reviewed. This variant of adenosarcoma does not appear to be more malignant than other adenosarcomas. It can and should be differentiated from embryonal rhabdomyosarcoma and malignant mixed müllerian tumor because of the different prognostic implications and therapeutic approaches.

Adenosarcoma, Uterus

The article describes the histories of 94 patients with a diagnosis of uterine sarcoma. Histologic features were studied by one of the authors and cases that did not meet strict pathologic criteria were rejected. The 71 patients with uterine sarcoma accepted for this study had a survival rate of 22.5% from 1611 years. Clinical staging had some predictive value, since 45 patients with stages II, III, and IV disease had only a 12%
survival rate. The type of treatment had no demonstrable effect on final outcome but did influence the recurrence patterns chemotherapy (used in 25 patients) was neither of benefit when used as adjuvant therapy nor effective in prolonging survival in patients with recurrence (mean survival, 5.4 months).

Chemical Diagnosis, Carcinoma, Uterus

Serum fucose levels and fucosyl transferase activities have been designated as non-specific markers of malignancy, and play an important role in the diagnosis of different types of malignancies. In the present study, attempts were made to determine the prognostic significance of these markers in patients with cancer of the uterine cervix after therapy. It was found that both serum fucose and fucosyl transferase, which were elevated in untreated patients declined significantly in patients responsive to therapy at different following intervals, but not in patients unresponsive to therapy.
Pathology, Carcinoma, Uterus

TROWEILL (JE). Intestinal metaplasia with argentaffin cells in the Uterine cervix. 9, 5; 1985, 551-9.

Three cases showing focal intestinal metaplasia of the endocervical glands are presented. The intestinal type epithelium contained absorptive cells, goblet cells and argentaffin cells, and resembled that found in intestinal types of mucinous ovarian tumors. Two of the cases were associated with squamous cell carcinoma-in-situ (CIN III), and both of these also showed borderline glandular malignancy.

Pathology, Adenosarcoma, Uterus

Clinical stage I carcinoma of the endometrium was evaluated in 222 patients. Twenty five percent of patients were found to have pathologic findings through to require postoperative external irradiation; of then, 20 of 57 had recurrence. During the 36 and 72 month follow up period only 14 of 165 treated only with operation or operation plus intracavitary radium manifested a recurrence.
Furthermore, of all recurrence, 27 of the 34 were outside the pelvis. In these surgically staged cases, the absence of definable, demonstrable extramural disease was associated with a 7% recurrence rate versus a 43% recurrence rate if disease was found anywhere outside the uterus. Recurrence and death were correlated with other prognostic factors which are outlined in this report.

Radiotherapy, Carcinoma, Uterus

It describes that the risk of second primary malignancy arising after therapeutic irradiation was evaluated in the Radiumhemmet series of carcinoma of the uterine cervix. Only tumors appearing more than 10 years after irradiation were taken into account. Comparisons of observed with expected incidence showed excess of malignancies in urinary bladder, endometrium, ovaries and rectum, but not of colon carcinoma. Comparisons were made with cohorts from the Swedish cancer Registry.
Chemotherapy, Carcinoma, Uterus

TURBOW (MM) and BALLON (SC). Cisplatin, dexorubicin, and cyclophosphamide chemotherapy for advanced endometrial carcinoma. *Cancer Treat. Rep.* 69, 5; 1985; 465-7

Nine of 19 patients (47%) with widespread or recurrent endometrial carcinoma responded to chemotherapy with cisplatin, dexorubicin and cyclophosphamide. Two complete clinical responses and seven partial responses were achieved. A 'second look' laparotomy addition cisplatin to dexorubicin and cyclophosphamide increased toxicity without increasing the anti-tumor activity previously reported for the tw-drug combination. Performance status had a marked influence on response, while sites of metastases amount of response rate. A scheme for the treatment of patients with endometrial carcinoma with progestins and/or cytotoxic chemotherapy is suggested.

Laser therapy, Malignant tumours, Uterus

TSUKAMOTO (N) Treatment of cervical intraepithelial neoplasia with the carbon dioxide laser. *Gynecol Oncol.* 21, 3; 1985; 331-36.

Between 1978 and 1983, one hundred and forty six patient with CIN-III were treated with the carbon dioxide
laser and 129 have been followed for 6 to 58 months. The remission rate was 29.2% after one treatment and 98.4% after two treatments. All persistent lesions were detected within 8 weeks after treatment. After confirmation of remission, 4 patients (3.1%) developed recurrence of CIN at an average of 37 months after treatment. The CO₂ laser therapy is safe, effective and cost saving for the patient, but a certain rate of recurrence is to be expected and the necessity of a long-term follow-up is stressed.

170 L 90, 556 : 472563

Fibrosarcoma, Breast, Oldage

On first examination of women from 40 to 59 years of age who participated in the National study of Breast Cancer Screening, the prevalence of fibroadenoma was 8.3 per 1000. In two women, a carcinoma was discovered within their fibroadenoma in ductal carcinoma in situ and an infiltrating ductal carcinoma in the other. Clinical and histopathologic findings are described and the prognosis and treatment discussed. The peak age of women at the time of diagnosis of a fibroadenoma is in their twenties while for those with a fibroadenoma
containing a carcinoma, it is in the forties. For patients under 25 years, excision can be postponed for a few months since spontaneous regression may occur and the risk of breast cancer is small at that age. For older women, treatment should not be delayed.

Carcinoma, Breast

A retrospective clinicopathologic review of 32 patients with mammary sarcoma exclusive of angiosarcoma or lymphoma was performed. For 25 patients with previously untreated lesions. The median tumor diameter was 4 cm. and 14 patients had high or intermediate grade lesions. One of 22 patients treated by mastectomy and one of three patients treated by local excision died of sarcoma yielding an actuarial 5 year survival of 91% the diagnosis of stromal sarcoma is best reserved for those infrequent sarcoma that can be traced to the specialized periductal and perilobular stroma of the breast. Total mastectomy is recommended for most patients with postoperative radiation therapy indicated when the adequacy of the margin is
in doubt. The role of adjuvant chemotherapy in the primary management of mammary sarcoma is yet to be determined.

Etiology, Carcinoma, Breast

HENDERSON (BE) and ROSS (RK) Do regular ovulatory cycles increase breast cancer risk? Cancer, 56, 5; 1985; 1206-8.

The 'estrogen window hypothesis' of the etiology of breast cancer proposes that unopposed estrogen stimulation is the most favourable state for tumor induction and that normal postovulation progesterone secretion reduces susceptibility. The authors believe that epidemiologic and experimental studies suggest rather that the opposite is true i.e. that breast cancer risk is directly related to the cumulative number of regular ovulatory cycles. Unlike the endometrium, breast tissue mitotic activity is enhanced in the luteal phase of the menstrual cycle. Regular vigorous physical activity is one method of reducing the frequency of ovulatory cycles, and such exercise could markedly reduce a woman's lifetime risk of developing breast cancer.
Clinical Diagnosis, Carcinoma, Breast

KHEMANI (AK) and KUSUM KAPILA. Carcinoembryonic antigen and estrogen receptor protein in breast cancer. Indian Journal of Medical Research 85, Jan; 1987; 61-3.

Presence of Carcinoembryonic antigen (CEA) was assessed by peroxidase antiperoxidase technique in paraffin blocks of tissues from 50 patients of carcinoma breast. Thirty three (66%) gave a positive reaction for CEA. Amongst the positives, a variation in the staining pattern was observed in different blocks from the same tumour. Carcinoembryonic antigen negative tumors tended to be more often positive for estrogen receptor protein (ERP) and vice versa of the CEA negative breast tumours, 64.7% were ERP positive, while only 40.6 per cent CEA positive cases were ERP positive.

Clinical Diagnosis, Carcinoma, Breast

DELCASTILLOL (R) and AUDISIO (T). Diagnostic value of the different methods for evaluation of bone metastasis and in breast carcinoma Eur. J. Gynaecol. Oncol. 6, 2; 1985; 128-33.

A group of 263 patients portraying breast Ca. stadified through the clinic, is studied and evaluated by different methods of diagnosis as regards bone metastasis. A clinical investigation of bone pain, specific laboratory
determinations for Ca-P-alcaline phosphatase; bone X-ray, bone scinitigraphy with gamma camara are carried on. In some pre-selected cases bone biopsy preformed. A 15.9 % of the patients with breast Ca showed bone metastasis. Scinlingraphy was positive in a 100 % of these cases, pain in 62 %, X-ray in 41 %. The final results of laboratory were discarded since they were not considered reliable. Highly specific positive zones for bone metastasis and benign bone pathology were detected when sectioning the spine in the classical zones. A methodological sequence is proposed.

Clinical Diagnosis, Carcinoma, Breast

Optimal diagnostic strategies used in screening for breast cancer and evaluating breast masses depend on the likelihood malignancy findings at physical examination, and the accuracy of tests and procedures. Results from published series, in conjunction with calculations of the probability of malignancy based on test results, indicate that only mammography is needed for screening. A clinical sequence for evaluating palpable breast masses should include a combination of mammography,
Ultrasound examination, and needle aspiration. In patients with negative findings, the probability of cancer will be sufficiently low to obviate the need for immediate surgical biopsy. However, if there are positive findings, or the initial clinical likelihood of malignancy is high, excision of the mass is indicated.

176 L 9E, 556: 47257; 402

Physical Pathology, Carcinoma, Breast, Adolescent

A case of microglandular adenosis of the breast in a 75-year-old woman is presented, with emphasis on the ultrastructural features. While the tumor was histologically similar to those reported previously in the literature, certain microscopic aspects suggested malignant change. Ultrastructurally, the characteristic findings were villus interdigitation between epithelial cells, thick basement membranes around individual tubules, and abundant apical lysosomal granules.

177 L 556; 47257; 625

Radiotherapy: Carcinoma, Breast

CUDKOWICZ (L) and CUNNINGHAM (M). Effect of mediastinal Irradiation upon Respiratory function following
A 5 year followup study of respiratory function in patients with mediastinal irradiation following mastectomy for carcinoma of the breast revealed the following:

Physiological dead space diminishes progressively, reaching a maximum decline at 12 months following irradiation. Partial recovery occurs thereafter with a leveling out at about 62% of the pre-radiation level. Pulmonary diffusing capacity also declines rapidly but recovery begins after 18 months and improves to within normal limits by the fifth year of the follow up. The residual volume immediately increases at the end of irradiation therapy but rapidly and permanently returns to normal.

Electrotherapy, Carcinoma, Breast

CHUCF (H) and NISCE (L). Treatment of Breast cancer with High-energy Electrons produced by 24 Mev Betatron

Radiology 81, Nov; 1963.

High energy electrons from a 24 Mev were used to treat cancer of the breast in 222 patients. One case of angiosarcoma and 3 of cancer in the mal breast were included in of the 218 female patients with carcinoma of the
of the breast 50 were treated for inoperable growths and 135 for recurrences in the chest wall, lymphnode metastases, or metastases at other sites. The remaining 33 received postoperative irradiation after radical or simple mastectomy or local excision of a tumor. The authors consider that the advantages of electron irradiation include convenient adjustment of the depth of penetration, absence of increased bone dose and satisfactory dose distribution in most cases.

179 L 556 : 47257 : 628

Chemotherapy, Carcinoma, Breast

Mitomycin is one of the most effective single agents in the treatment of advanced breast cancer. Recent studies have also shown that combination regimens including mitomycin are effective as initial therapy in advanced breast cancer. In patients with advanced disease who fail to respond to chemotherapy, a combination regimen including mitomycin is as effective as the other combinations currently used in salvage therapy. A combination of mitomycin and a drug such as doxorubicin or vinblastine produces results equivalent to those reported with regimens more commonly used. Suchas
combination is a therapeutic alternative in patients with advanced breast cancer.

Chemotherapy, Carcinoma, Breast

HARVEY (HA) and LIPTON (A). Medical Castration produced by the Gn RII analogue leuprolide to treat metastatic breast cancer. J. Clin. Oncol. 3, 8; 1985; 1068-72.

Leuprolide, a gonadotropin - releasing hormone analogue, was administered to 26 premenopausal women with metastatic breast cancer. Of 25 evaluable patients, 11 (44%) had a partial response with a medium duration of 89 weeks and five (20%) remained stable. Six patients showed early rapid progression of their disease. Toxicity was mild and included not flashes, nausea, vomiting, and headache. Leuprolide induced amenorrhea in all patients who received treatment of ten weeks or longer. We conclude that this Gn RH analogue provides a safe and effective means of producing medical castration in premenopausal patients with metastatic breast carcinoma.
Surgery, Carcinoma, Breast

Twelve cases of breast cancer were treated by modified radical mastectomy using a CO₂ laser. Another twelve cases of breast cancer were treated conventionally using a scalpel and electro-cautery for the purpose of comparison. Laser surgery offers some advantages. The conventional surgery involved more blood loss and needed blood transfusion, whereas laser surgery produced a 200 ml to 400 ml blood loss with no need for transfusion. Since in laser surgery, cutting and ligation is by sealing, the laser operations took a shorter time, from 1.5 hours to 3 hours. In conclusions, laser surgery can provide a very safe and effective method in the treatment of breast cancer.

Adenosarcoma, Prostate

SHONG-SAN (C) and WALTERS (MNI). Adenoid cystic carcinoma of prostate: Report of a case Pathology 16, 3; 1984, 337-8.

A case of adenoid-cystic carcinoma of the prostate is presented. The differential diagnosis and a brief discussion of the possible histogenesis is presented.
Adenosarcoma, Prostate

LINEHAN (WM) and KISH (ML). Human prostate carcinoma cases hypercalcemia in a thymic nude mice and produces a factor with parathyroid hormone-like bioactivity. J. Urol. 135, 3; 1986; 616-20.

The mechanism of the calcium and phosphorus abnormalities associated with metastatic prostate carcinoma (Ca P) is not yet understood. A tumor model was recently established in which 9479, a human Ca P from a patient with prostate carcinoma—induced osteomalacia, was heterotransplanted into a thymic nude mice (ANM). In the present study the effect of 9497 on ANM was evaluated. Serum calcium (Ca) phosphorus (P), parathyroid hormone (PTH), 1, 25-dihydroxyvitamin D₃ (1, 25-(OH)₂ D₃) and urinary AMP were measured. Ca was markedly elevated in ANM bearing 9479 Vs. Agermatched controls (C); the increased Ca returned to control level after tumor removal. These data suggest tumor induction of parathyroid hormone-like hormonal modulation of calcium phosphate and vitamin D metabolism in vivo associated with a parathyroid hormone-like prostate carcinoma product.
Carcinoma, Prostate

MICHEL (F) and GATTEGNO (B). Primary non-seminomatous germ cell tumor of the prostate. *J. Urol.* 135, 3; 1986; 597-9.

The authors described a case of a primary non-seminomatous germ cell prostatic tumor and discussed the problem of extragonadal germ cell tumor. Prognosis, staging and management of these tumors are similar to that of metastatic primary testicular germ cell tumor.

Carcinoma, Prostate

In this article authors reported a rare presentation of Carcinoma of the prostate simulating filariases.

Examination of Tissue, Carcinoma, Prostate

PAPSIDERO (LD) and CROGHAN (GA). Immunohistochemical demonstration of prostate specific antigen in metastases with the use of monoclonal antibody F 5. *Am. J. Pathol.* 121, 3; 1985; 451-4.
With the use of a murine monoclonal antibody (P5), a panel of metastatic tumors was evaluated for the expression of prostate-specific antigen (PSA) under immunoperoxidase staining procedures. Specimens studied included 25 of prostatic origin and 73 originating from non-prostatic primary sites. Regardless of the site of dissemination or the malignancy grade, all metastases from the prostate were antibody reactive. In contrast, non-prostatic metastases were negative in each case, including those originating from other genitourinary neoplasms. Thus, PSA expression as detected with monoclonal antibody P5 is a stable characteristic of disseminated prostatic tumors.

MWAWZA CHABUNDA (KC). Metabolic irradiation of painful metastasis from prostatic Carcinoma with strontium 85. J. Eur. Radiother. 6, 2; 1985; 89-93.

85 Sr has been given intravenously in order to relieve pain in 27 cases of hyperergic generalised bone metastasis from prostatic carcinoma. A long-lasting analgesia and stabilising effect has been noted in 19 patients after one or more doses of 1 to 2 mCi of 85 Sr chloride. Follow-up concerns mainly hematologic effects and pain relief, which varies from 3 to 32 months. Relationship between extent of lesions and effect on pain is discussed.
Radiotherapy, Carcinoma, Prostate

Author 5 analyzed all patients who had undergone pre-radiation staging pelvic lymphadenectomy from 1969 to 1979. Of 70 patients with a minimum follow-up of 5 years 33 had positive and 37 had negative nodes. Three of the 33 patients with positive lymph nodes were alive without disease at the time of our study, compared to 20 of 37 with negative lymph nodes. Author's review suggests that extended field radiation has minimal or no impact on the natural history of prostatic carcinoma in patients with positive nodes. Patients with stages T_1 and T_2 lesions and negative nodes do well with external beam therapy.

Radiotherapy, Adenosarcoma, Prostate

To evaluate the prognostic significance of post irradiation biopsy results in patients with prostatic cancer
the authors reviewed the records of 803 patients who had been treated with pelvic lymph node dissection, radioactive gold seed implantation and external beam irradiation. Of the patients 124 had 1 or more biopsies within 6 to 36 months of completion of radiotherapy when there was no evidence of local or distant recurrence of tumor. Patients were followed for a mean of 64 months and received no other therapy before relapse. Overall 43 of these patients had a positive biopsy result, the incidence of positive biopsy results correlated directly with the initial stage of the tumor ranging from 22% of stage B1N to 50% of stage C1 lesions.

Radiotherapy, Carcinoma, Prostate

LING (D) and LEE (JKT). Prostatic carcinoma and be high prostatic hyperplasia: Inability of MR imaging to distinguish between the two disease Radiology. 158; 1; 1986; 103-7.

Fifty patients with prostatic carcinoma or be high prostatic hyperplasia (BPH) underwent magnetic resonance (MR) imaging of the prostate. In vitro MR images of six prostate specimens were also obtained. The prostatic parenchyma was best evaluated by a $T_2$-
weighted spin-echo pulse sequence. The prostate both in patients with prostatic carcinoma and patients with BPH often had an inhomogeneous and nodular appearance on T2-weighted images. While most of the prostatic carcinomas appeared hypointense relative to muscle and adjacent prostatic parenchyma, some of the hyperplastic nodules had a signal intensity similar to carcinoma. With current imaging techniques, MR imaging can not differentiate prostatic carcinoma from BPH with certainty.

Chemotherapy, Carcinoma, Prostate

Fifty-eight patients with advanced, progressing prostatic cancer resistant to conventional therapy have been assessed for their response to treatment with aminoglathethimide (A/G). Eleven men (19%) had objective regression of their disease while in a further eight (14%) progression of the disease was arrested. Median survival in the objective remitters (15 months) and in the group whom stabilization of disease occurred (9.3 months)
was significantly longer than in the non-remitting patients (4.7 months). The drug was well tolerated and no serious side effect occurred. A/G appears to be a useful treatment in patients with advanced prostatic cancer resistant to conventional therapy.

Surgery, Carcinoma, Prostate

The luteinizing hormone releasing hormone, zoladex, has been used in three centers to treat carcinoma of the prostate. An initial protocol using a soluble daily injection has been followed by a second study employing a monthly administered depot preparation. After an initial stimulation it has been shown that both daily and monthly injections reduce plasma testosterone to castrate levels. Circulation luteinizing hormone levels are also initially stimulated and then suppressed. Treatment toxicity has been minimal and in these short term studies reduction of acid phosphatase and subjective and objective tumour responses have been similar to those expected from effective hormonal therapy of prostatic cancer.
Surgery, Carcinoma, Prostate

101 patients with different stages of carcinoma of the prostate underwent 'open perineal cryotherapy'. The age of the patients varied between 44 and 80 years. The benefit of this method was a lower rate of complications than in radical prostatectomy with a similar cumulative survival rate in stage B disease. No immunological response was found in this study. Neopterin values - an easily detectable parameter for the J-lymphocyte-macrophage activity and urinary neopterin excretion immediately after cryosurgery remained in the normal range. In stage D patients no metastases disappeared. Further studies showed no effect on the pituitary gonadal axis after cryotherapy of the prostate.

Symptom, Carcinoma, Thyroid

Russell (Maiza A) and GILBERT (F). Prognostic features of Thyroid cancer. *Cancer*, 36, 2; 1975; 553-9.

Sixty-eight cases of thyroid cancer were followed for 10 to 38 years after diagnosis. A minimum follow up
period of 10 years was necessary because of the large natural history of low-grade thyroid carcinoma. The prognosis of the disease was evaluated with regard to several parameters: age, sex, histologic appearance of the tumor, extent of disease and treatment. The best prognosis was found in women less than 40 years of age with papillary carcinoma in whom there was neither extrathyroid extension nor metastasis and who were treated by surgery alone. Extrathyroidal cancer in the neck treated by radical neck dissection had a 100% survival rate at 15 years post diagnosis. The poorest prognosis was in male patients over 60 years of age with metastatic undifferentiated carcinoma.

Clinical Diagnosis, Carcinoma, Thyroid

SIOHU (Jagmohan S) And GUPTA (Sudarshan). Carcinoma Thyroid: An Analysis of 57 cases over a 10 years period The Quarterly J. of Surg. Sciences 22, 3-4; 1986; 49-59.

Incidence of carcinoma of the thyroid gland is low and in author's study carcinoma of thyroid formed 0.98 percent of all malignant tumours of the body. Out of total thyroid neoplasms, carcinomas were 14.4 per cent. Papillary carcinoma (49.9 %) and follicular carcinoma (38.6%) constituted the major histopathological types. Medullary carcinoma and squamous cell carcinoma were the
least common varieties (3.5 per cent each). Anaplastic carcinoma formed 5.3 per cent. The average age at which the carcinoma of thyroid presented was 48.8 years, and female to male ratio was 28.1:1. The commonest presenting feature was a solitary nodule.

Clinical Diagnosis, Carcinoma, Thyroid

STEINFELD (Carroll M) and MOERTEL (Charles G). Diarrhea and Medullary carcinoma of the thyroid. Cancer 31, 4; 1973, 1237-9.

A retrospective analysis of patients with medullary carcinoma of the thyroid was undertaken to determine the frequency and characteristic of diarrhea associated with the tumor of 111 patients. 36 had diarrhea as a clinical symptom either before diagnosis of the primary neoplasm or during the course of the metastatic malignant disease. The diarrhea was usually modest in frequency and loose or watery; two patients had mild steatorrhea. An additional two patients had significantly elevated urinary secretion of 5-hydroxyindoleacetic acid. Medullary carcinous can produce a variety of circulating substances some of which may have a significant effect on gastrointestinal motility.
197 L 65 : 47257 : 32

Physical Diagnosis, Carcinoma, Thyroid

EVANS (DOughlas M). Diagnostic discriminants of Thyroid Cancer Am. J. Surg. 153, 6; 1987; 569-70.

The results of thyroid cintiscanning and ultrasonography are reviewed retrospectively in 110 consecutive patients with thyroid cancer. The author concluded that neither ultrasonography nor scintiscanning are reliable discriminants of thyroid cancer.

198 L 65 : 47257 : 4

Pathology, Carcinoma, Pathology

SCLARE (G) and NICOL (A). Carcinoma of the thyroid in Myxoedema Journal of Clinical Pathology. 17, July; 1964; 438-43.

3 cases of Carcinoma of the thyroid were found. The first case was that of a 64 year old female who had myasthenia gravis of 12 years and in whom myxoedema had been diagnosed 18 months before death. At necropsy the thyroid gland weighed 14.5 g and contained pale nodules up to 0.5 cm in diameter. The second patients, a 70 years old female, died 7 week after myxoedma was diagnosed the thyroid gland (5.5 g) was fibrotic and contained foci of plasma cells and lymphocytes, one focus of spheroidal cell carcinoma was present in the
right lobe and two such foci were present in the left lobe. In the third case, that of 65 years old female with diabetes nullitus death occurred shortly after myxoedema was diagnosed. The thyroid gland (19 g) contained fibrous tissue, nodules 1 to 3 mm. diameter consisting of inflammatory cells and acini containing pleomorphic, distorted epithelial cells. The authors concluded that the widespread nature of the epithelial change to geoplasia suggests, by analogy with experimental observations, that chronic overstimulation of the thyroid gland by thyrotropic hormone may be related to the diffuse induction of neoplasia.

Ceau Pathology, Carcinoma, Thyroid

LONDON (G) and ORDONEL (NG) Clear Cell variant of medullary carcinoma of the Thyroid; Hum Pathol. 16, 8; 1985; 844-7.

A previously unreported clear cell variant of medullary thyroid carcinoma is described. This histologic appearance was observed in sections from both the primary thyroid tumor and a vertebral metastasis. This variant merits recognition because it may be confused with a variety of other tumors occurring in the thyroid that contain cells with optically clear cytoplasm. Immuno-histochemical and ultrastructural studies can be helpful
in establishing the diagnosis of these tumours.

Cell Pathology, Carcinoma, Thyroid

ZAJAC (D) and PENSCHOW (J). Identification of calcitonin and calcitonin gene-related peptide messenger ribonucleic acid in medullary thyroid carcinomas by hybridization histochemistry *Clin. Endocrinol*. 62, 5; 1986; 1037 - 93.

Synthesis and secretion of calcitonin and calcitonin gene-related peptide (CGRP) were studied in medullary thyroid carcinomas (MTC) by hybridization histochemistry on tissue sections and by Northern gel analysis of mRNA. Five patients with MTC and elevated serum levels of calcium and CGRP were studied. Surgically obtained tumor samples were extracted after freezing and the RNA was fractionated on Northern gels. Hybridization was carried out with 32 p-labeled synthetic oligodeoxynucleotides coding specifically for calcitonin and CGRP. Calcitonin and CGRP. Specifically MRNAs as approximately 1000 nucleotides in length were demonstrated in all 7 tumor samples. However, neither calcitonin nor CGRP in RNA was detected in a pheochromocytoma from 1 of the patients who had multiple endocrine neoplasia type II. A series of unselected lung carcinomas yielded the same results.
Cell Pathology, Carcinoma, Thyroid

BERGE I LEFRANCE (JL) and CARTOUZOU (G). Qualification of thyroglobulin messenger RNA by in situ hybridization in differentiated Thyroid Cancer. Cancer 56, 2; 1985; 345-50

Thyroglobulin messenger RNA (in RNA) was located and quantified in tissue section of differentiated human thyroid cancers by in situ hybridization using cloned differentiated follicular and papillary forms contained similar levels of thyroglobulin in RNA, corresponding to about 2000 copies per cell. In contrast, cell of moderately differentiated thyroid cancers contained about two to three times less thyroglobulin in RNA.

It was also found that thyroglobulin in RNA was present almost exclusively in polyribosomes under the form of heavy polyribosomes activity synthesizing thyroglobulin. It is suggested that in situ hybridization method allows localization of specific in RNA in differentiated thyroid cancers and correlation with the level of differentiation of the cells.

Radiotherapy, Carcinoma, Thyroid

SRIDAMA (Y) and HARA (Y). Association of differentiated thyroid carcinoma with HLA-DR7. Cancer 56, 5; 1985; 1086-88.
Seventy-four American white thyroid cancer patients were typed for HLA-A, B and DR antigens. A significant increase in HLA-DR7 was found in the non radiation associated thyroid cancer patients, compared to 22.8% of 979 normal controls. The association is stronger in the follicular and mixed papillary follicular subgroup. The occurrence of various malignancies in family members was found in 57.9% of HLA-DR7 positive patients, versus 20% of HLA-DR7 negative patients, in a retrospective record review. Although the frequency of HLA-DR7 was not increased in the radiation associated thyroid cancer patients, the interval from the irradiation date to the onset date of thyroid cancer was shorter in HLA-DR7 positive cases (173 ± 6.24 years) than in HLA-DR7 negative patients (29.4 ± 11.5 years). This data suggest that HLA-DR7 is associated with and may influence development of thyroid cancer.

Radiotherapy, Carcinoma, Thyroid

Two hundred and fifty-eight patients treated with high activity 131 I thyroid cancer and on prolonged follow
up have been reviewed to determine long-term hazards and their relation to the radiation dose received. The expectation of life of those dying from causes other than cancer was slightly reduced in the female patients. A small, significant excess of deaths from cancer of the bladder and from leukaemia was found with assuming that these were due to radiation, gave inferred risk-rates respectively of 0.4 and 4.9 deaths per $10^4$ PYG to the bladder wall and red narrow. of 31 younger patients. Four of the marriages have been infertile. The fertile marriages produced a total of 44 live births. Considerable gonad irradiation was compatible with apparently normal fertility. Despite the high level of irradiation of the salivary glands, no malignancies and only one adenoma was found.
X-RAY THERAPY, CARCINOMA, THYROID

SHORE (R.) and WODERD (L.). Thyroid tumors following thymus irradiation. J. Natl. Cancer Inst. 74, 6; 1985; 1177-84.

About 2,650 patients who received X-ray treatment for purported enlarged thymuses in infancy and 4,800 sibling controls have been followed by mail questionnaire for an average of 29 years to observe their incidence of thyroid tumors. The following rate in the latest survey was 88% in both groups. The radiation doses to the thyroid gland ranged from 5 to over 1,000 rad, with 62% receiving less than 50 rad. To date 30 thyroid cancers and 59 benigns thyroid adenomas have been detected in the irradiated group, as compared with 1 thyroid cancer and 8 adenomas in the control group. Within the limitations imposed by the treatment regimens and the sample size, there was no thyroid of a "spare" effect due to close fractions for either thyroid cancer or adenomas.

SURGERY, CARCINOMA, THYROID

LIPTON (RICHARD J) and McCAFFRY (Thomas V). Surgical treatment of invasion of the upper Aerodigestive tract by well Diferentiated Thyroid Carcinoma. Am-J.Surg. 154, 4 1987; 363-617.
Forty eight patents with well-differentiated carcinoma invading upper, aerodigesting tract structures are described. Age at diagnosis was a negative prognostic factor and duration of disease before, invasion, a positive factor. Radical surgery and adjuvant therapy provided no improvement in survival over near total excision with adjuvant therapy. The authors believe that partial resection of upper aerodigestive tract structures with out sacrifice of voice normal breathing and swallowing should be considered in these patients.

206. 165:47257:7
SURGERY, CARCINOMA, THYROID

MARCHEGIANI(C) and LUCCI(S). Thyroid Cancer: Surgical Experience with 322 cases. International Surgery 70,2; 1985; 121-4.

A total of 322 thyroid cancers were treated surgically. Total thyroidectomy was the treatment of choice. In 131 patients, modified neck dissection cumilaterally in 23 and bilaterally in 1087 was added, of dissection. There were no operative deaths. No recurrent languageal herv iatrogenic pasly was observed. permanent parathyroid insufficiency developed in only about 4% of patients. The low monbidity and good long-term results justify the use of this procedure in all patients with thyroid malignancies.
RICHARD (HIlYe) and RICHARD (T Ramsdén). Trigeminal nerve tumor. Journal of Neurosurgery. 67, 1, 1987; 124-7

Benign tumors of the middle fossa components of the trigeminal are rare. The authors describe the case history, radiological investigation, and operative findings of a patient with a large trigeminal neurofibroma of the middle fossa. The unusual mode of presentation is discussed. Valuable information was provided by magnetic resonance imaging prior to successful removal to this tumor.

FREREBEAU(P) and BENEXECH(J). Intraventricular tumors in tuberous sclerosis. Child's Nerv Syst. 1,1;1985;45-8.

Eleven cases of tubercous sclerosis with intraventricular tumor and 34 cases from the literature are reviewed. Initial symptoms and identification of tubercous sclerosis and tumor are reviewed. Results of surgical treatment, including direct radical excision and shunting are given. On gross examination, the tumor was most often loosely connected to ependyma bear the foremen of monro, causing hydrocephalus. Giant cell subependymal astrocytoma was frequently found on microscopic examination. The glial origin of the tumor is discussed and direct surgical approach of the tumor is proposed as the best treatment of these lesions.
A case of a primary rhabdomyosarcoma that appeared to be arising from the filum terminale in a 48-year-old male is reported. The histological diagnosis of rhabdomyosarcoma was supported using immunocytochemical methods. Twenty-two cases of primary rhabdomyosarcoma of the central nervous system previously reported in the literature are reviewed briefly. The possible origin of these tumors from neuroectoderm is discussed.

A case of malignant teratoma arising near the third ventricle in an adult is reported. It represented a true teratoma containing elements of all three germ layers of which two, namely the mesenchymal and endodermal elements have undergone malignant change. It was characterized by rapid recurrences after two operations with death occurring shortly after the second operation.
MALIGNANT TUMORS, BRAIN, INDUSTRIAL WORKERS

To explore the association between occupation and the occurrence of brain tumor, an epidemiologic study was conducted using data from the death certificates of 951 adult white male Maryland residents who died of brain tumor. Compared with the controls, men employed in electricity related occupations, such as electrician, electric to electronic engineer, and utility company servicemen, were found to experience a significantly higher proportion of primary brain tumors. An increase in the odds ratio for brain tumor was found to be positively related to electromagnetic(EM) field exposure levels. Furthermore, the mean age at death was found to be significantly younger among cases in the presumed high EM-exposure group. Three findings suggest that EM exposure may be associated with the pathogenesis of brain tumors, particularly in the promoting stage.
212. L9E, 72: 47255

MYXOSARCOMA, BRAIN, OLD AGE

A rare case of astroblastoma of the pure type occurring in the left occipital lobe of a 54 year old female is reported. The predominant histologic feature was that of perivascular pseudorosettes. The tumor tissue were not stained by the Mallory's phosphotungstic acidhematoxylin, but the penikarya of some tumor cells were, positively stained for the glial fibrillary acidic protein.

213. L9C, 72: 47258

ADENOSARCOMA, BRAIN, CHILDREN

Primary cerebral neuroblastoma most often occurs in the cerebral parenchyma in children. When it occurs in adults, it is also described as an intraparenchymal heoplasm. Authors report three cases of primary cerebral neuroblastoma in adults presenting as an intraventricular mass.
A characteristic feature of chondomas is the content of a great amount of mucinous material. A sacrococcygeal chordoma surgically removed from a 76 year-old man was histologically investigated in order to obtain some information about the composition of the mucopolysaccharides. From the results of the acid category and probably a mixture of weakly sulphate and carboxylated glycoproteins.

Patients with a brain-stem tumor were studied with NMR. The full extent of the lesion as well as its relationship with the adjacent structures was clearly demonstrated in all cases. Although NMR is in many aspects, superior to CT, and angiography, these examinations remain useful complementary methods.
PATHOLOGY, CARCINOMA, BRAIN

The relationship between the levels of serum acute phase reactant proteins di-acid glycoproteins with glioblastoma multiforme in relation to their prognosis. di-acid glycoprotein was higher in the patients who died within one year after admission than in those with a larger survival time.

It is suggested that serum di-acid glycoprotein profiles provide prognostic information in patients with glioblastoma multiforme.

GIANGASPERO (F) and BURGER (P). Regulatory peptides in neuronal neoplasms of the central nervous system. Clin. Neuropathol. 4, 3; 1985; 111-5.

Neuromal tumors of CNS were examined immunohistochemically for regulatory peptides. Thirteen ganglion cell neoplasms, one cerebellar ganglioneuroblastoma, one cerebellar neuroblastoma, and four medullablastomas were studied. Sixteen neuronal intracranial neoplasms were examined as controls.
Immunoreactive vesicoactive intestinal polypeptide (VIP) was observed in seven cases of ganglion cell neoplasm and in the one case bellar anglioneuroblastoma. The result suggest that CNS ganglion cell neoplasms share with their extracranial counterparts the production of certain hormonal polypeptides. The immuno histochemical detection of these substances may provide diagnostically useful technique in the diagnosis of such lesions.

218. L72:47257:411

CELL PATHOLOGY, CARCINOMA, BRAIN

Because cytologic preparations capture the fine cellular detail that frozen sections often obscure, touch and smear preparations are valuable adjacents to intraoperative histologic diagnoses.

PSOTMARTOM-EXAMINATION, MALIGNANT TUMORS; BRAIN, FEMALE

YOSHIDA (K) and TOYA (S) Extraneural metastasic of chorio-carconomatous element in pineal germ-cell tumor;Case report. J. Neurosurg. 6,3, 3; 1985, 463-6.

A case of pineal germ-cell tumor producing human chorionic gonado tropin (hca) and alpha-fetoprotein (AFP) is reported
in a 23 year old man. Extraneural metastasis developed during a course of combined chemotherapy after radiation therapy. Postmortem examination revealed that the metastatic pulmonary tumor was a choriocarcinoma, producing only HCG.

COHADOW(F) and ACUAD(N) Histologic and non-histologic factors correlated with survival time in supratentonal astrocytic tumors. J.Neuro-oncol 3,2, 1985; 105-11.

One hundred and ninety two case of supratentorial astroctic tumors are classified in 4 groups according to the presence or absence in the pathological material of simple morphological criteria: abnormal cellular density nuclear pleomorphism, neovascularization, necrosis. Each one of these criteria is strongly correlated with prognosis. Nevertheless only a simple classification in low and high grade lesions has a definite predictive value. A multivariate analysis utilizing Cox’s hazard function confronts these histological findings with a number of clinical and etiological possible factors of prognosis. Age and performance status at the time of diagnosis are the best predictors of survival time. The clinical use of predictive model derived from Cox’s function analysis is discussed.

Thirty-nine patients who completed whole-brain irradiation treatment for brain metastases from malignant melanoma were analyzed. Median survived was 2 months, mean survival 4 months, only 3 patients survived for 1 year, the longest survival being 19 months after irradiation. Twenty one (53.8%) showed marked clinical improvement and 6 (40%) of the 15 evaluable patients had some objective regression of the brain of the brain metastases. A treatment of 7 fractions of 4.8 in 9 to 14 days and concomitant chemotherapy with dacarbazine and lomuatin in 16 patients was well tolerated. This seems to be a beneficial treatment for patients with a comparatively small intracranial tumour burden.

Radiation therapy, malignant tumors, brain

Survival and prognosis of patients with astrocytoma with atypical or anaplastic features J. Neuro-Oncol. 3, 2; 1985; 99-103.
This study confirms the importance of histologic tumor necrosis as a major proghestic variable in malignant glioma. Necrosis is present in glioblastoma multiforme (GBM), and absent in astrocytoma with atypical or anaplastic features (A\&F). This paper evaluates 94 patients with A\&F and 462 patients with GBM treated with radiation therapy with or without BCNU on 3 consecutive randomized protocols of the radiation therapy oncology group (RTOG).

X-Ra Diagnosis, Osteosarcoma, Bone

Iro (Tasuhika) and Okuyama (Shinichi) Bone marrow scintigraphy in the early diagnosis of experimental metastatic bone carcinoma. Cancer 31, 4; 1973; 1222-30.
Paralleled experimental studies of radiostopic bone marrow imaging bone scanning, and skeletal radiologic surgery were undertaken upon the intramedullary-implanted and hematogenously metostalic UX-2 rabbit bone carcinoma in order to see their temporal relationship in delineating such lesions. Both bone and bone narrow scans turned positive for earlier than the X-rays. Moreover, lesion-depicting marrow scanning appears to be one of the techniques of choice in the early diagnosis of metastatic skeletal malignancies.

OSTEOSARCOMA, BONE

A recurrent obsteoblastoma involving the acetebulum in a 27 year-old woman was found to be locally aggressive and histologically appeared to become more anaplastic with each recurrence. However, there was no evidence of distant metastases similar cases have been reported under such names as pseudomalignant or malignant osteoblastoma. In view of the prolonged clinical course without evidence of distal metastases, the term agressive 'osteoblastoma' seems to be more appropriate. The treatment of choice for such tumors should be further en-bloc resection, avoiding the morbidity and possible mortality of the chemotherapy demanded by true malignant tumor of bone, as well as unnecessary ablative surgery.
OSTEOSARCOMA, BCNL

HUDSON (T M) and SPRINGFIELD (IJG) Computed tomography of parosteal osteosarcoma. Am J Roentgenol. 144,5; 1985; 961-5.

Twelve patients with perosteal osteosarcomas were evaluated by computed tomography (CT). CT accurately defined the extent of the tumors for purpose of surgical planning, although tumor bone often could not be distinguished from thickened host bone. Nine tumors invaded the medullary cavity a feature that impiles a poorer prognosis when the tumor also contains highgrade areas. Six CT studies accurately detected the medullary invasion, but three did not. Fucent areas within dense tumors contained either benign tissue or high or low-grade tumor, CT did not differentiate among these different tissues. CT also did not reveal small satellit nodules of tumor beyond the main tumor.

LEE (YS) and PHO (RWH). Malignant fibrous histiocytoma at site of metal implant. Cancer 54, 10; 1984; 2286-9.

The occurrence of malignant tumors at the site of metal implants is rare. The significance of this association is not settled. Its implications, however, are serious. A malignant fibrous histiocytoma arising at the site of an implant done 14 years ago for traumatic fracture of the tumor in a 44 years old man is reported. Previous reports are briefly summarized.
PREGNANCY, OSTEOSARCOMA, BONE, FEMALE
HUVOS (AG) and BRETSKY (SS) Osteogenic sarcoma in pregnant women. Prognosis therapeutic implications, and literature review. Cancer 56, 9; 1985-2326-31.

This study of 18 pregnant women with concomitant osteogenic sarcoma of bone analyzes the important assertion whether this sarcoma and pregnancy have an adverse interaction. For comparison authors matched the pregnant osteogenic sarcoma patients with nonpregnant women with the same skeletal tumor location and histologic appearance as well as similar age distribution. There was no worsening of prognosis of pregnant osteogenic sarcoma patients, and neither the pregnancy nor the disease appeared to act adversely towards the other. The 18 pregnant women with osteogenic sarcoma fared no better than the nonpregnant women with osteogenic sarcoma.

PATHOLOGY, OSTEOSARCOMA (EWINGS) BONE
SHIRLEY (SK) and ASKIN (FB) Ewing’s Sarcoma in bones of the hands and feet. A clinicopathologic study and review the literature. J.Clin.Oncol. 3,5; 1985, 686-97.

Review of current data from the Inter-group Eqings sarcoma study (IESS) shows that Ewing’s sarcoma (ES) is rare in
bones of the hands and feet. Only 12 to 377 evaluable patients in the first two IBSS studies had a primary tumor in these small, distal bones. The age distribution was typical for that seen in patients with ES at other sites. Males were affected twice as often as females, and tumors in the bones of the feet were much more common than those in the hands. All signs and symptoms were local in distribution. As in other sites the dominant histologic pattern was categorized as diffuse. With the exception of those patients with lesions in the calcaneus, the prognosis for disease free survival was excellent. A literature review of cases of ES reported in bones of the hands and feet showed generally comparable results.

230. L82:47252:3
CLINICAL DIAGNOSIS, CHONDROSARCOMA, BONE
ADEGBITE (ABO) and McJULEN (JD). Primary intracranial Chondrosarcoma. A report of two cases. Neurosurgery 17, 3;1985;490 -4.

Two cases of primary intracranial chondrosarcoma are presented the cases were similar in that they both, arose from the temporal bone, contained both myxomatous tissue and material of cartilaginous, consistency, and were avascular histological studies excluded the diagnosis of chondroid chordoma. A brief review of the subject is presented.
CLINICAL DIAGNOSIS, OSTEOSARCOMA, BONE

Osteoblastoma as a case of back pain, scoliosis and reversible neurological deficit has received scant attention in the neurosurgical literature. The tumor has a predilection for the spine, occurs in young people for cure. Eight cases of spinal osteoblastoma in children and adults are reported demonstrating the spectrum of the disease, pitfalls of diagnosis and treatment, and prognosis.

PATHOLOGY, OSTEOSARCOMA, BONE

Of 160 cases of osteosarcoma seen over an 18 years period, 18 were over the age of 40 at the time of presentation. The clinical presentation and histology of the cases is reviewed. Delay in referral and incorrect histological diagnosis were frequent. Only 2 cases were associated with Paget's disease.
Radiologic and pathologic findings were analyzed in four patients with parosteal osteosarcomas, three with periosseal osteosarcomas three with perisoteal osteosarcomas and one with a high-grade surface osteosarcoma. Plain film and histologic findings considered together are usually distinctive and permit differentiation of these tumors from each other and from other lesions with which they are frequently confused. Prognosis and management are determined by tumor extent and histologic grade. Computed tomography is more accurate than conventional tomography, angiography, and bone scintigraphy for preoperative determination of tumor extent and for assessing tumor relationships to the bone cortex and medullary cavity. High-grade surface osteosarcoma which is indistinguishable in behavior and history from classical medullary osteosarcoma, requires more aggressive surgical management than parosteal and perisoteal osteosarcomas.
TISSUE PATHOLOGY, OSTEOSARCOMA, BONE.
The authors carried out a prospective histologic and immunoenzymatic study using lysozyme and A antichymotrypsin of 15 well documented cases of giant cell tumors of bones. The histologic appearance of the majority of the tumors was characterized by great pleomorphism. The predominant histologic patterns could be classified as either fibroblastic or histologic. Mitoses were seen exclusively on stromal mononuclear cells. All tumors showed positive marking with both lysozyme and A-antichymotrypsin. The result indicate that giant cell tumor of bones may result from the neoplastic proliferation of mononuclear cells which in many areas of the tumor differentiate to either fibroblasts or histiocytes. Thus, giant cell tumor of bones may be analogous to fibrohistiocytic tumors of soft tissues.

INJECTION THERAPY, OSTEOSARCOMA, BONE
The serum concentration of alpha-1-acid glycoprotein, haptoglobin and alpha-1 antitrypsin have been estimated serially in eight patients with malignant tumors of bone and soft tissue who received a total of thirty-four intravenous infusions of high-dose methotrexate. The serum glycoprotein levels taken before the first drug exposure did not relate with the prognosis of these patients. A tumors mass (40 mm) did not influence the serum levels of these glycoproteins. The presence of a pleural effusion was associated with increased serum levels of these glycoproteins. These assays appear to be of no value in monitoring the course of the disease in this group of cancer patients.

236. L82:47251: 625

RADIOTHERAPY, OSTEOSARCOMA, BONE

ALLEN (Clifford V) and STEVENS (Kenneth R). Preoperative irradiation for osteogenic sarcoma. Cancer. 31,4;1973;1364-6. Highdose preoperative irradiation with delayed disarticulation of an extremity involved with osteogenic sarcoma has resulted in a marked increase of tumor free survival in a small series of cases. Treatment was well tolerated without significant complications. The surgical specimen in most of the survivors contained no viable carcinoma after irradiation in the jorden of 10,000 rads. There is evidence that biopsy in suspected lesions should be performed without tourniquet to avoid flushing of the tumor cells from the marrow cavity. Discussion will include rational for delayed surgery, possible influence of irradiation on immense factors and techniques of irradiation.
237. L82:47251:628

CHEMOTHERAPY, OSTEOSARCOMA, BONE

JAFFE(N) and ROBERTSON(R) Control of primary osteosarcoma with chemotherapy. Cancer. 56, 3; 1985; 461-6.

High-dose methotrexate with citrovorum factor 'rescue' (MTX-CF) produced an apparent complete response of the primary tumor in three patients with osteosarcoma. The response was sustained with MTX-(F), intra-arterial cis-diaminedichloroplatinum in II (CDP) and Adriamycin (doxorubicin) for 18 months. Treatment was then electively discontinued. Local recurrent occurred in two patients 6 and 4 months later, respectively. MTX-CF was reinstated and a complete response was again achieved in one patient. A complete response in primary tumor was still present in the nonrelapsed patients, 42 months from diagnosis. All patients have remained free of pulmonary metastases, 40 to 42 + months from diagnosis.

238. L82:47251:628

CHEMOTHERAPY, CARCINOMA, BONE

Of 54 unselected patients with osteogenic sarcoma metastatic to the lung who were entered into two successive prospective studies, 16 presented with synchronous pulmonary metastases (PM) and primary tumor and 38 developed PM during or after chemotherapy. After complete resection of pulmonary lesions, the SR was significantly higher than after incomplete resection (P < 0.01). The authors could not demonstrate a significant association between the number of pulmonary metastases resected and SR. After demonstration they concluded that chemotherapy is capable of improving the prognosis in osteogenic sarcoma metastatic to the lung.

239. L82:47251:628

CHEMOTHERAPY, OSTEOSARCOMA, BONE

Ninety-five children with localized Ewing's sarcoma were included in a prospective cooperative study. All patients received initial chemotherapy with the purpose of early prevention of metastases and improvement of the conditions of the subsequent local therapy, radiotherapy in all cases, surgical resection in selected cases. Clinical response to initial chemotherapy was evaluated in 67 patients who had measurable soft-tissue mass or functional symptoms. This
response appeared highly correlated without come as the
disease free survival was 57.3% for the 41 good responders
and 9% for the 26 bad responders (p 0.00001), though 23 of
these bad responders reached complete remission with
radiotherapy. This study also confirms the prognostic
significance for survival of the site of the primary tumor
on axial skeleton or on limbs. Nevertheless this factor had
no predictive value for response to chemotherapy, which thus
appears to be an independent factor.

240. L87:47257

CARCINOMA, SKIN

EUIS(DL) and WHEELAND(G) Estrogen and progesterone receptors
in Melanocytic lesions. Occurrence in patients with dysplastic
Estrogen and progesterone binding studies in a series of 22
melanocytic lesions from 14 patients with the dysplastic
nevus syndrome were done using a fluorescent estrogen and
progesterone binding technique. Melanocytic lesions from
these patients, including primary cutaneous melanomas
dysplastic nevi, and benign nevi, contained large number of
estrogen and progesterone binding cells. Comparison is made
to a series of control intradermal nevi that had little or
no detectably estrogen or progesterone binding. Increased
hormonal binding, and possibly responsiveness, is seen in
melanomas, melanoma precursor lesions such as dysplastic
nevi and congenital nevi as well as benign nevi from patients
with the dysplastic nevus syndrome.
CARCINOMA, SKIN

A retrospective review of 832 patients who died with head and neck cancer was performed to determine the incidence and sites of distant metastases. At autopsy, a total of 47 percent of the patients had distant disease with the hypopharynx having the highest incidence. The initial stage of disease was found to be related to distant disease. Distant metastases developed in 55 percent of the stage IV patients.

CARCINOMA, SKIN, INDUSTRIAL WORKERS

SPINK(PS) and BAYNES(AH). Skin carcinoma in the process of "Stanford joining". Journal of Industrial Medicine 21, April 1964, 154-7.

This paper described the occurrence of skin carcinoma in 3 out of 200 workmen engaged in "Stanford jointing" a process which consists in the application of a jointing compound to earthenware pipes used as conduits for underground electric cables. The compound is composed of tar, sulphur, and a filter and is poured into pipes at a temperature of approximately 120°C. A mineral oil, known as brick oil is used to
smear those parts of pipe to which the compound must not adhere. The skin of arms and lungs becomes contaminated by the oil through splashing. In the 3 cases described the average age to onset of skin cancer and the average duration of exposure to the oil were, rather lower than in other, industries in which mineral oil is a factor. The authors state that the processes has how been mechanized so that the likelihood of future exposure being sufficient to cause cancer in very slight.

243. L87-912:47257
CARCINOMA, ORALCAVITY, SKIN
The authors report that tumor thickness is the only significant independent variable in estimating prognosis in patients with squamous cell carcinoma of the buccal mucosa in this study of 89 patients seen between 1959 and 1985.

244. L87-212:4725n:3
DIAGNOSIS, CARCINOMA, ORALCAVITY, SKIN
BARTTELBOR(T(SCOTT W) and RIM (Saul L). Rim Mandi bulectomy for cancer for cancer of the oral cavity Am. J. Surg. 154, 4; 1987; 423-8.
This is a retrospective analysis of 38 patients who underwent either a traditional segmental resection of the mandible or a rim mandibulectomy with preservation of the mandibular arch. Equivalent local control rates between the two groups were demonstrated; however, the patients with rim mandibulectomy had a better postoperative appearance and were able to wear lower dentures and dental bridged in order to chew food.

245. L87:47251:31

CLINICAL DIAGNOSIS: CARCINOMA, SKIN

The patient with basal cell carcinoma of the skin has sometimes been thought to run an increased risk for developing other malignancies. A retrospective cohort study of 468 cases including about 4400 person-years of observation did not reveal a significant deviation from expected values estimated either from cancer register date or from cancer incidence in matched controls.

246. L87:47251:31

CLINICAL DIAGNOSIS: CARCINOMA, SKIN

LAGERHOLM (B) and SKOG (E) Squamous cell carcinoma in Psoriasis Vulgasis. Acta dermato-venereologica. 48; 1968; 128-36.
From the review of the relevant literature in which about 50 cases have been reported, the authors conclude, that the occurrence of squamous-cell carcinoma in association with psoriasis vulgaris is extremely rare. Authors discuss the possible relationship between psoriasis and cancer. They consider that there is insufficient evidence as yet that pruritic lesions can undergo a direct carcinomatous transformation, but they draw attention to the occasioned occurrence of such transformation in other chronic skin diseases, such as ulcer cruris and lichen planes.

297. L87:4725:325

MICROSCOPE, MALIGNANT TUMORS, SKIN

ILLIH(t) and WEIDNER(F). Congenital nevi 10 cm as precursors to melanoma: 52 cases, a review, and a new conception Arch. Dermatol. 121, 10; 1985; 1274-81.

Fifty-two congenital melanocytic nevi (CMN) as precursors to melanoma or severe melanocytic dysplasia were reviewed macroscopically and microscopically. Forty-eight small 'CMN' measured less than 10 cm in diameter histologically, only five reached to the lower third of the dermis or subcutis (deep type) the remaining 47 were limited to the upper two thirds of the corium. There were 47 invasive melanomas, two in situ melanomas, and three severe focal melanocytic dysplasias. All melanomas were of epidermal origin and primarily of the superficial spreadint type. The age at diagnosis ranged from 18 to 79 years. prepubertal melanomas were not observed.
RADIOThERAPY, MALIGNANT TUMORS, SKIN

DEWIT (L) AND NAFTELINK (H). Concurrent cis-diamminedichloro
roplatinum (II) and radiation treatment for melanoma meta-

Thirteen evaluable patients with 25 melanomas metastases
were treated by radiotherapy, 6 x 6 hy in 6 weeks and
concomitant weekly cisplatinum infusion 20, 30 or 40mg/m².
Acute local skin reaction did not appear to be enhanced.
Symptomatic bowel spasm occurred in 2 of 4 patients treated
on an iliac-inguinal field, both having received a high
drug dose (40 mg/m²). Late severe and disabling subcutaneous
fibrosis was encountered in 2 of 8 patients with a minimal
follow-up of 6 months, suggesting that cis-platinum concur-
rently given, enhances late radiation damage to connective
tissue, although possible contribution of other factors
cannot be ruled out. Concentration of total platinum, measured,
in tumor at the time of first irradiation, approach the
minimal concentration assumed to be required for radio-
sensitizing effects of cis-platinum.

ADJUVANT THERAPY, MALIGNANT TUMORS, SKIN

KOH (HK) AND SOBER (AJ). Adjuvant therapy of cutaneous malig-
1985; 244-60.
The emergence of revised definitions for the high-risk patient with cutaneous malignant melanoma prompts authors to examining the current status of adjuvant therapy in this disease. The authors wish to address the question once a cutaneous melanoma is surgically removed and the patient is currently free of disease but at high risk for metastases, what can be done to prevent recurrence?

250. L87:4725:628
CHEMOTHERAPY, MALIGNANT TUMORS, SKIN
Fifty-one patients with metastatic melanoma were treated with cisplatin, viublastine, and bleomycin of the 50 evaluable patients, 11(22%) achieved an objective response, including three complete(6%) and eight partial (16%) responses. Four of the 11 responding patients had received no prior chemotherapy. Responses were noted in cutaneous and lymphshode sites as well as visceral metastases. However, with one exception, all responding patients with visceral involvement had lung metastases. Response duration were brief and toxicity was substantial. Nadir leuocyte counts $0.5 \times 10^9/\mu l$ occurred in 28% of the patients. Debilitating neurotoxicity, primarily paralytic, leus, and severe nausea and emesis were
experienced by 24% of the patients. The combination of cisplatin, viublastine, and bleomycin is not sufficiently beneficial to warrant its use in metastatic melanoma.

251. L87:4725: 628

CHEMOTHERAPY, MALIGNANTUMOUS, SKIN

Sixty-five previously untreated patients with metastatic malignant inclanona were treated with lomustine, vincristine, and procarbazine. Sixty-four patients were evaluable for response, with a response rate of 13%, only one complete, response was observed, in a patient with nodel disease only. Three partial responses were observed in patients with disease confined to soft tissue, indicate that in asymptomatic people with only few inclusion bodies and latent in infections, culture on M Cav and four partial responses were observed in patients with palmonary metastases. Median survival for all patients was 22 weeks authors conclude that this regimen of jers no improvement compared to other drug combinations.
CHEMOTHERAPY, MALIGNANT TUMORS, SKIN

A phase II trial of gallium nitrate (250-300 mg/m²/day for 7 consecutive days) was conducted in patients with metastatic melanoma. Therapy was well-tolerated, but only one of 31 evaluation of gallium nitrate at this dose and schedule is not warranted in patients with malignant melanoma.

CHEMOTHERAPY, MALIGNANT TUMORS, SKIN

Bilateral hilar lymphadenopathy developed in a parazale, 200 mg. There were no significant intergroup treatment differences indicating that single-dose treatment one year after excision of a malignant melanoma of the left arm. There were no signs of distant metastases. Hilar lymphnode biopses specimen a obtained by mediastinoscopy.
showed multiple noncaseating granulomas consistent with sarcoidosis, without evidence of tumor cells. Sarcoidosis developing in the course of a preexisting neoplasim is rare, but must be considered in order to establish a proper diagnosis and withhold unnecessary treatment.

OAT cell carcinoma of the pancreas with ectopic acth secretion

Occupational exposure to electromagnetic field and the occurrence of brain tumors: An analysis of possible associations

Occurrence of other malignancies in patients treated for based cell carcinoma of the stomach: A cohort study

Ocular and orbital tensions: Surface coil MR imaging

Open perineal cryosurgery in carcinoma of the prostate: A possible curative alternative

Operative fine needle aspiration cytology of pancreatic tumor

Orbital tumor irradiation using non coplamer beams

Osteogenic sarcoma in pregnant women: prognosis, therapeutic implications, and literature review

Osteosarcoma after the fourth decade: a clinicopathological review

Ovarian tumors in pregnancy: A community Hospitals five-year experience surgery

Palliative laser surgery for melanoma metastases to the larynx: Report of two cases

Pancreatic Cancer. Adjunct combined radiation and chemotherapy following curative resection

Pathological fracture, bone metastases and primary hepatocellular carcinoma
Phase II studies of mitoxantrone in patients with primary liver cancer

Phase II trial of gallium nitrate: 4 patients with advanced malignant melanoma

Place of mass Radiography in relation to lung cancer in men

Premalignant epithelial lesions of the gall bladder:
A Prospective study of 20 cholecystectomy specimens

Preoperative irradiation for osteogenic sarcoma

Prevalence Prognostic Significance and hormonal content of endocrine cells in gastric cancer

Primary Cancers of extra hepatic biliary passages

Primary Cardiac tumors: Experience with 30 consecutive patients since the introduction of two dimensional echocardiography

Primary Carcinoma of the gallbladder

Primary Carcinoma of renal Pelvis

Primary Combined small cell carcinoma of the larynx

Primary Fibrosarcoma of liver

Primary gastric choriocarcinoma

Primary hepatic tumors in pediatrics

Primary liver carcinoma

Primary nonseminomatous germ cell tumor of the prostate
Primary intracranial chondrosarcoma: A report of two cases
Primary osteosarcoma of the larynx
Primary orbital lymphoma pseudotumor
Primary rhabdomyosarcoma of the central nervous system
Primary Sarcoma of the Gallbladder
Primary tumors of the heart
Prognosis renal cell carcinoma with venacava and renal vein involvement
Prognostic features thyroid cancer
Prognostic significance of post irradiation biopsy result in patients prostatic cancer
Prognostic significance of serum & acid glycoprotein in patients with glioblastoma multiforme: A Preliminary communication
Prostatic carcinoma: 5:- year followup of patients with surgically staged disease under going extended field radiation
Prostatic carcinoma and benign prostatic hyperplasia: Inability of the imaging to distinguish between the two disease
Pulmonary embolism in patients receiving chemotherapy for advanced ovarian cancer
Pulmonary metastases from osteogenic sarcoma: Complete resection and effective chemotherapy contributing improved prognosis
Qualification of thyroglobulin messenger RNA by insituhybridization in differentiation thyroid cancer

Radiologic manifestations of early gastric lymphoma

Radiation therapy for brain metastases for malignant melanoma

Recurring cardiac myxoma

Renal angiomyolipoma: 6 case reports and literature review

Renal cell carcinoma with metastasis to the submandibular and parotid glands: A Case report

Response to initial chemotherapy as a prognostic factor in localized Ewing's Sarcoma

Regulatory peptides in neuronal neoplasms of the central nervous system

Results of surgical treatment of gallbladder carcinoma

Rhabdomyosarcomas uterine adenosarcoma

Rim mandibulectomy for cancer of the oral cavity

Risk factors and recurrent patterns in stage I endometrial cancer

Roentgenologically acute lung cancer Diagnosed by cytology Report of 12 cases

Rubidomycin in acute leukemias in Adults
SailaDexecum papilliformis 23
Salivary duct carcinomas of the exudid gland: cytologic and histopathologic study 22
Saoliosis: a case of bilateral hilar lymph node enopathy after excision of malignant melanoma of the arm 253
Sarcoma of the breast: A study of 32 patients with reappraisal of classification and therapy 171
Serum CA 19-9 Concentrations and computed tomography finding in patients with pancreatic carcinoma 75
Skin carcinoma in the process of standard joining 242
Spinal osteoblastoma in children and adolescents 230
Squamous cell carcinoma in psorias'is vulgur's
Squamous cell carcinoma of the Buccal mucosa. Analysis of Pronostic factors 243
Stem Cell carcinoma of the colon & rectum: Report of two cases and review of the literature 42
Stromal andperipheral eosinophilia incermed carcinoma 161
Strumen carcinoid of the ovary 148
Study of the prognostic role of serum fucose and fucosyb transferase in cancer of the uterine cervix 164
Studies of Leukocytokinetics incriomie lymphocytic leubemia 108
Surgical Approach of Renal cell carcinomaeextending into the Right Atum through the inferior vena cava 144
Surgical management of gastric adenocarcinoma 41
Surgical management of renal cell carcinomawith caratumor thrombus 145
Survival study of intestinal and diffuse types of hostric carcinoma
Surgical treatment of invasion of the Upper Aerodigestive tract by well-Differentiated thyroid carcinoma.
Survival and prognosis of patients with astrocytoma with atypical or anaplastic features
Telangiectatic hamartoma of the iris and ciliary body
Thyroid cancer: Surgical Experience with 322 cases
Thyroid tumors following thymus irradiation
Thickening of pelvic fascia of carcinoma of the rectum
Treatment of advanced prostatic cancer, resistant to conventional therapy, with aminogluthethimide
Treatment and prognosis of mucoepidermoid carcinoma in the pediatric age group
Treatment of Breast cancer with High-energy electrons produced by 24-Mev Betatron
Treatment of cervical intraepithelial neoplasia with the carbon dioxide laser
Treatment of ovarian cancer with combination of operative, radiation and chemotherapy
Trigeminal nerve tumor
Tumors of the Heart
Tumor of the heart diagnosed by magnetic resonance imaging
Ultrasound examination during polichemotherapy for ovarian cancer
Unilateral simultaneous renal angiomyolipoma and oncocytoma
Unusual leiomyosarcoma of the citerus containing osteoclast like giant cell

Unusual presentation of carcinoma of the prostate

Use of cytological preparations in the frozen section diagnosis of central nervous system neoplasia

Uterine sarcoma: Analysis of prognostic variables 1471 cases
